

# Package ‘spict’

July 12, 2019

**Type** Package

**Title** Stochastic Surplus Production Model in Continuous-Time (SPiCT)

**Version** 1.3

**Date** 2019-07-12

**Maintainer** Alexandros Kokkalis <alko@aqu.dtu.dk>

**Author** Martin W. Pedersen [aut],  
Casper W. Berg [aut],  
Tobias Mildenerger [ctb],  
Alexandros Kokkalis [ctb, cre]

**Description** Fits a surplus production model to fisheries catch and biomass index data.

**License** GPL ( $i=3$ )

**Copyright** Martin Waever Pedersen

**Depends** R ( $i=3.0$ ),  
TMB

**Imports** graphics,  
methods,  
stats,  
utils

**LinkingTo** TMB, RcppEigen

**Suggests** parallel,  
mgcv,  
rjags,  
coda,  
knitr,  
rmarkdown,  
DLMtool

**LazyData** true

**VignetteBuilder** knitr

**RoxygenNote** 6.1.1

**BugReports** <https://github.com/mawp/spict/issues>

**Encoding** UTF-8

acf.signf	<i>Check whether ACF of residuals is significant in any lags.</i>
-----------	---

---

**Description**

This corresponds to plotting the ACF using acf() and checking whether any lags has an acf value above the CI limit.

**Usage**

```
acf.signf(resid, lag.max = 4, return.p = FALSE)
```

**Arguments**

- resid            Vector of residuals.
- lag.max        Only check from lag 1 until lag.max.
- return.p       Return p-values of the calculated lags.

**Value**

Vector of TRUE and FALSE indicating whether significant lags were present. If return.p is TRUE then p-values are returned instead.

---

add.catchunit	<i>Add catch unit to label</i>
---------------	--------------------------------

---

**Description**

Add catch unit to label

**Usage**

```
add.catchunit(lab, cu)
```

**Arguments**

lab	Base label
cu	Catch unit as a character string

**Value**

Label with added catch unit

---

add.col.legend	<i>Add a legend explaining colors of points (vertical orientation)</i>
----------------	--

---

**Description**

Add a legend explaining colors of points (vertical orientation)

**Usage**

```
add.col.legend()
```

**Value**

Nothing.

---

add.col.legend.hor	<i>Add a legend explaining colors of points (horizontal orientation)</i>
--------------------	--

---

**Description**

Add a legend explaining colors of points (horizontal orientation)

**Usage**

```
add.col.legend.hor()
```

**Value**

Nothing.

---

add.manlines	<i>Add lines to plot indicating result of management scenarios.</i>
--------------	---

---

**Description**

Add lines to plot indicating result of management scenarios.

**Usage**

```
add.manlines(rep, par, par2 = NULL, index.shift = 0,
  plot.legend = TRUE, ...)
```

**Arguments**

rep	A result report as generated by running fit.spict.
par	The name of the parameter to be plotted.
par2	If a second parameter should be used as explanatory variable instead of time.
index.shift	Shift initial time point by this index.
plot.legend	logical, if TRUE (default) adds legend to the plot
...	Additional arguments passed to <a href="#">lines</a>

**Value**

Nothing

**See Also**

[lines](#)

---

annual	<i>Convert from quarterly (or other sub-annual) data to annual means, sums or a custom function.</i>
--------	--

---

### Description

Convert from quarterly (or other sub-annual) data to annual means, sums or a custom function.

### Usage

```
annual(intime, vec, type = "mean")
```

### Arguments

intime	A time vector corresponding to the values in vec.
vec	The vector of values to convert to annual means
type	If type='mean' then annual mean is calculated, if type='sum' then annual sum is calculated. If type is a function, that function is used.

### Value

A list containing the annual means and a corresponding time vector.

---

arrow.line	<i>Draw a line with arrow heads.</i>
------------	--------------------------------------

---

### Description

Add to an existing plot a continuous line with arrow heads showing the direction between each data point.

### Usage

```
arrow.line(x, y, length = 0.25, angle = 30, code = 2,
  col = par("fg"), lty = par("lty"), lwd = par("lwd"), ...)
```

### Arguments

x	X coordinates.
y	Y coordinates.
length	See documentation for arrows.
angle	See documentation for arrows.
code	See documentation for arrows.

col	See documentation for arrows.
lty	See documentation for arrows.
lwd	See documentation for arrows.
...	See documentation for arrows.

### Value

Nothing, but an arrow line is added to the current plot.

---

calc.EBinf	<i>Calculate <math>E(B_{\infty})</math>, i.e. the fished equilibrium.</i>
------------	---

---

### Description

Calculate  $E(B_{\infty})$ , i.e. the fished equilibrium.

### Usage

```
calc.EBinf(K, n, F1, Fmsy, sdb2)
```

### Arguments

K	The carrying capacity.
n	Pella-Tomlinson exponent.
F1	Average fishing mortality of the last year.
Fmsy	Fishing mortality at MSY.
sdb2	Standard deviation squared (variance) of B process.

### Details

If a seasonal pattern in F is imposed the annual average F is used for calculating the expectation. `Max()` is used to avoid negative values.

### Value

$E(B_{\infty})$ .

---

calc.gamma	<i>Calculate gamma from n</i>
------------	-------------------------------

---

**Description**

Calculate gamma from n

**Usage**

```
calc.gamma(n)
```

**Arguments**

n	Exponent of the Pella-Tomlinson surplus production equation.
---	--

---

calc.influence	<i>Calculates influence statistics of observations.</i>
----------------	---

---

**Description**

Calculates influence statistics of observations.

**Usage**

```
calc.influence(rep)
```

**Arguments**

rep	A valid result from fit.spict().
-----	----------------------------------

**Value**

A list equal to the input with the added key "infl" containing influence statistics.

---

calc.osa.resid	<i>Calculate one-step-ahead residuals.</i>
----------------	--

---

### Description

In TMB one-step-ahead residuals are calculated by sequentially including one data point at a time while keeping the model parameters fixed at their ML estimates. The calculated residuals are tested for independence, bias, and normality.

### Usage

```
calc.osa.resid(rep)
```

### Arguments

`rep` A result report as generated by running `fit.spict`.

### Value

An updated result report, which contains one-step-ahead residuals stored in `$osarC` and `$osarI`.

### Examples

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.osar(rep)

## End(Not run)
```

---

check.ini	<i>Check sensitivity of fit to initial parameter values</i>
-----------	---

---

### Description

Check sensitivity of fit to initial parameter values

### Usage

```
check.ini(input, ntrials = 10, verbose = TRUE, numdigits = 2)
```

**Arguments**

input	Either an inp list passing check.inp(), or a rep list where rep is the output of running fit.spict().
ntrials	The number of trials with different starting values to run.
verbose	If true write information to screen.
numdigits	Number of digits in reported results.

**Value**

List containing results of sensitivity check and associated initial values.

---

check.inp	<i>Check list of input variables</i>
-----------	--------------------------------------

---

**Description**

Check list of input variables

**Usage**

```
check.inp(inp)
```

**Arguments**

inp	List of input variables, see details for required variables.
-----	--

**Details**

Fills in default values if missing.

Required inputs:

- "inp\$obsC" Vector of catch observations.
- "inp\$obsI and/or inp\$obsE" List containing vectors of index observations and/or a vector of effort information.

Optional inputs:

- Data

- "inp\$timeC" Vector of catch times. Default: even time steps starting at 1.
- "inp\$timeI" List containing vectors of index times. Default: even time steps starting at 1.
- "inp\$timeE" Vector of effort times. Default: even time steps starting at 1.
- "inp\$dtc" Time interval for catches, e.g. for annual catches inp\$dtc=1, for quarterly catches inp\$dtc=0.25. Can be given as a scalar, which is then used for all catch observations. Can also be given as a vector specifying the catch interval of each catch observation. Default: min(diff(inp\$timeC)).

- "inp\$dte" Time interval for effort observations. For annual effort inp\$dte=1, for quarterly effort inp\$dte=0.25. Default: min(diff(inp\$timeE)).
- "inp\$nseasons" Number of within-year seasons in data. If inp\$nseasons  $\neq$  1 then a seasonal pattern is used in F. Valid values of inp\$nseasons are 1, 2 or 4. Default: number of unique within-year time points present in data.

- Initial parameter values

- "inp\$ini\$logn" Pella-Tomlinson exponent determining shape of production function. Default: log(2) corresponding to the Schaefer formulation.
- "inp\$ini\$logm" Initial value for logm (log maximum sustainable yield). Default: log(mean(catch)).
- "inp\$ini\$logK" Initial value for logK (log carrying capacity). Default: log(4\*max(catch)).
- "inp\$ini\$logq" Initial value for logq (log catchability of index). Default: log(max(index)/K).
- "inp\$ini\$logsdB" Initial value for logsdB (log standard deviation of biomass process). Default: log(0.2).
- "inp\$ini\$logsdF" Initial value for logsdF (log standard deviation of fishing mortality process). Default: log(0.2).
- "inp\$ini\$logsdI" Initial value for logsdI (log standard deviation of index observation error). Default: log(0.2).
- "inp\$ini\$logsdC" Initial value for logsdC (log standard deviation of catch observation error). Default: log(0.2).
- "inp\$ini\$phi" Vector for cyclic B spline representing within-year seasonal variation. Default: rep(1, inp\$nseasons).
- "inp\$ini\$logsdU" Initial value for logsdU (log standard deviation of log U, the state of the coupled SDE representation of seasonality). Default: log(0.1).
- "inp\$ini\$loglambda" Initial value for loglambda (log damping parameter of the coupled SDE representation of seasonality). Default: log(0.1).

- Initial values for unobserved states estimated as random effects

- "inp\$ini\$logF" Log fishing mortality. Default: log(0.2\*r), with r derived from m and K.
- "inp\$ini\$logB" Log biomass. Default: log(0.5\*K).
- "inp\$ini\$logU" Log U, the state of the coupled SDE representation of seasonality. Default: log(1).

- Priors

Priors on model parameters are assumed generally assumed Gaussian and specified in a vector of length 2: c(log(mean), stdev in log domain, useflag [optional]). NOTE: if specifying a prior for a value in a temporal vector e.g. logB, then a fourth element is required specifying the year the prior should be applied. log(mean): log of the mean of the prior distribution. stdev in log: standard deviation of the prior distribution in log domain. useflag: if 1 then the prior is used, if 0 it is not used. Default is 1. To list parameters to which priors can be applied run list.possible.priors(). Example: intrinsic

growth rate of 0.8 `inp$priors$logr <- c(log(0.8), 0.1) inp$priors$logr <- c(log(0.8), 0.1, 1) #`  
 This includes the optional useflag Example: Biomass prior of 200 in 1985 `inp$priors$logB`  
`<- c(log(200), 0.2, 1985) inp$priors$logB <- c(log(200), 0.2, 1, 1985) #` This includes the  
 optional useflag Example: Inverse gamma prior on  $sdb^2$ : `inp$priors$isdbsdb2gamma <- mean-`  
`var2shaperate(1/exp(inp$ini$logsdbsdb)^2, 150^2)`

- Settings/Options/Preferences

- `"inp$dtpredc"` Length of catch prediction interval in years. Default: `max(inp$dtc)`. Should be 1 to get annual predictions and 0.25 for quarterly predictions.
- `"inp$timepredc"` Predict accumulated catch in the interval starting at `$timepredc` and `$dtpredc` into the future. Default: Time of last observation. Example: `inp$timepredc <- 2012`
- `"inp$timepredi"` Predict index until this time. Default: Time of last observation. Example: `inp$timepredi <- 2012`
- `"inp$do.sd.report"` Flag indicating whether SD report (uncertainty of derived quantities) should be calculated. For small values of `inp$dteuler` this may require a lot of memory. Default: TRUE.
- `"inp$reportall"` Flag indicating whether quantities derived from state vectors (e.g. `B/Bmsy`, `F/Fmsy` etc.) should be calculated by SD report. For small values of `inp$dteuler` ( $\leq 1/32$ ) reporting all may have to be set to FALSE for `sdreport` to run. Additionally, if only reference points of parameter estimates are of interest one can set to FALSE to gain a speed-up. Default: TRUE.
- `"inp$robflagc"` Flag indicating whether robust estimation should be used for catches (either 0 or 1). Default: 0.
- `"inp$robflagi"` Vector of flags indicating whether robust estimation should be used for indices (either 0 or 1). Default: 0.
- `"inp$ffac"` Management scenario represented by a factor to multiply `F` with when calculating the `F` of the next time step. `ffac=0.8` means a 20% reduction in `F` over the next year. The factor is only used when predicting beyond the data set. Default: 1 (0% reduction).
- `"inp$dteuler"` Length of Euler time step in years. Default: 1/16 year.
- `"inp$phases"` Phases can be used to fix/free parameters and estimate in different stages or phases. To fix e.g. `logr` at `inp$ini$logr` set `inp$phases$logr <- -1`. To free `logalpha` and estimate in phase 1 set `inp$phases$logalpha <- 1`.
- `"inp$osar.method"` Method to use in TMB's `oneStepPredict` function. Valid methods include: `"oneStepGaussianOffMode"`, `"fullGaussian"`, `"oneStepGeneric"`, `"oneStepGaussian"`, `"cdf"`. See TMB help for more information. Default: `"none"` (i.e. don't run this).
- `"inp$osar.trace"` If TRUE print OSAR calculation progress to screen. Default: FALSE.
- `"inp$osar.parallel"` If TRUE parallelise OSAR calculation for speed-up. Default: FALSE.
- `"inp$catchunit"` Specify unit of catches to be used in plotting legends. Default: `"`.
- `"inp$stddevfacC"` Factors to multiply the observation error standard deviation of each individual catch observation. Can be used if some observations are more uncertain than others. Must be same length as observation vector. Default: 1.

- "inp\$stdevfacI" Factors to multiply the observation error standard deviation of each individual index observation. Can be used if some observations are more uncertain than others. A list with vectors of same length as observation vectors. Default: 1.
- "inp\$stdevfacE" Factors to multiply the observation error standard deviation of each individual effort observation. Can be used if some observations are more uncertain than others. A list with vectors of same length as observation vectors. Default: 1.
- "inp\$mapsdi" Vector of length equal to the number of index series specifying which indices that should use the same sdi. For example: in case of 3 index series use inp\$mapsdi j- c(1, 1, 2) to have series 1 and 2 share sdi and have a separate sdi for series 3. Default: 1:nindex, where nindex is number of index series.
- "inp\$seasontype" If set to 1 use the spline-based representation of seasonality. If set to 2 use the oscillatory SDE system (this is more unstable and difficult to fit, but also more flexible).

### Value

An updated list of input variables checked for consistency and with defaults added.

### Examples

```
data(pol)
(inp <- check.inp(pol$albacore))
```

---

extract.simstats	<i>Extracts relevant statistics from the estimation of a simulated data set.</i>
------------------	--

---

### Description

Extracts relevant statistics from the estimation of a simulated data set.

### Usage

```
extract.simstats(rep, inp = NULL, exp = NULL, parnames = NULL)
```

### Arguments

rep	A result report as generated by running fit.spict.
inp	The input list used as input to the validation.spict function.
exp	Should exp be taken of parameters?
parnames	Vector of parameter names to extract stats for.

### Value

A list containing the relevant statistics.

**Examples**

```
## Not run:
data(pol)
repin <- fit.spict(pol$albacore)
sim <- sim.spict(repin)
rep <- fit.spict(sim)
extract.simstats(rep)

## End(Not run)
```

---

fd	<i>Format date</i>
----	--------------------

---

**Description**

Format date

**Usage**

```
fd(d, dec = 2)
```

**Arguments**

d	Point in time in years as decimal number.
dec	Number of decimals.

**Value**

Correctly formatted date.

---

fit.aspic	<i>Fits aspic to the data contained in the input file</i>
-----------	---

---

**Description**

Fits aspic to the data contained in the input file

**Usage**

```
fit.aspic(input, do.boot = FALSE, nboot = NULL, ciperc = NULL,
  verbose = FALSE, filebase = "tmp", savefile = NULL)
```

**Arguments**

input	A spicet input list containing observations.
do.boot	Do bootstrap to get uncertainties of estimates?
nboot	Number of bootstrap runs (only used if do.boot=TRUE). Prager suggests in the ASPIC manual p. 13 to use nboot $\geq$ 1000 if ciper $\geq$ 80.
ciper	Coverage percentage (integer between 0 and 100) of bootstrapped confidence intervals.
verbose	If TRUE write information to screen.
filebase	Basename of all generated aspic files.
savefile	Save results to this file.

**Value**

List containing aspic results.

**Note**

This function works only in linux and requires that wine and aspic7 are installed and available to the PATH.

---

fit.jags

---

*Fit the Meyer & Millar model using rjags*

---

**Description**

Fit the Meyer & Millar model using rjags

**Usage**

```
fit.jags(inp, fn, n.iter = 10000, n.chains = 1,
  burnin = round(n.iter/2), thin = 1000)
```

**Arguments**

inp	Input list containing data and settings.
fn	Filename of containing BUGS code.
n.iter	Number of iterations.
n.chains	Number of chains.
burnin	Number of burn-in iterations.
thin	Thin chains by this value.

**Value**

The raw output of rjags::coda.samples.

---

fit.meyermillar

*Fit the model of Meyer & Millar (1999)*

---

## Description

Fit the model of Meyer & Millar (1999)

## Usage

```
fit.meyermillar(mminp)
```

## Arguments

mminp                    Input list similar to the input to fit.spict()

## Details

Same input structure as for fit.spict(). Fitting the model of Meyer & Millar requires the packages rjags and coda. It furthermore requires that priors are specified for K, r, q, sigma2 (process error variance) and tau2 (observation error variance). Following Meyer & Millar (1999) the priors are:

- "K" log-normal.
- "r" log-normal.
- "q" inverse-gamma.
- "tau2" inverse-gamma.
- "sigma2" inverse-gamma.

See example for how to specify priors.

## Value

List containing results

## Examples

```
## Not run:
priors <- list()
priors$K <- c(5.042905, 3.76)
priors$r <- c(-1.38, 3.845)
priors$iq <- c(0.001, 0.0012)
priors$itau2 <- c(1.709, 0.00861342)
priors$sigma2 <- c(3.785518, 0.0102232)
priors$logPini <- -0.223
data(pol)
inp <- pol$albacore
inp$meyermillar$n.iter <- 10000
inp$meyermillar$burnin <- 1000
```

```

inp$meyermillar$thin <- 10
inp$meyermillar$n.chains <- 1
inp$meyermillar$priors <- priors
res <- fit.meyermillar(inp)
summary(res$jags)

## End(Not run)

```

---

fit.spict

*Fit a continuous-time surplus production model to data.*

---

## Description

Fits the model using the TMB package and returns a result report containing estimates of model parameters, random effects (biomass and fishing mortality), reference points (Fmsy, Bmsy, MSY) including uncertainties given as standard deviations.

## Usage

```
fit.spict(inp, dbg = 0)
```

## Arguments

inp	List of input variables as output by check.inp.
dbg	Debugging option. Will print out runtime information useful for debugging if set to 1. Will print even more if set to 2.

## Details

Model parameters using the formulation of Fletcher (1978):

- "logn" Parameter determining the shape of the production curve as in the generalised form of Pella & Tomlinson (1969).
- "logm" Log of maximum sustainable yield.
- "logK" Log of carrying capacity.
- "logq" Log of catchability vector.
- "logsdb" Log of standard deviation of biomass process error.
- "logsdf" Log of standard deviation of fishing mortality process error.
- "logsdi" Log of standard deviation of index observation error.
- "logsdc" Log of standard deviation of catch observation error.

Unobserved states estimated as random effects:

- "logB" Log of the biomass process given by the stochastic differential equation:  $dB_t = r \cdot B_t \cdot (1 - (B_t/K)^n) \cdot dt + sdb \cdot dW_t$ , where  $dW_t$  is Brownian motion.
- "logF" Log of the fishing mortality process given by:  $dlog(F_t) = f(t, sdf)$ , where the function  $f$  depends on the choice of seasonal model.

Other parameters (which are only needed in certain cases):

- "logphi" Log of parameters used to specify the cyclic B spline representing seasonal variation. Used when `inp$nseasons > 1` and `inp$seasontype = 1`.
- "logU" Log of the state of the coupled SDE system used to represent seasonal variation, i.e. when `inp$nseasons > 1` and `inp$seasontype = 2`.
- "loglambda" Log of damping parameter when using the coupled SDE system to represent seasonal variation, i.e. when `inp$nseasons > 1` and `inp$seasontype = 2`.
- "logsdu" Log of standard deviation of process error of U\_t (the state of the coupled SDE system) used to represent seasonal variation, i.e. when `inp$nseasons > 1` and `inp$seasontype = 2`.
- "logsde" Log of standard deviation of observation error of effort data. Only used if effort data is part of input.
- "logp1robfac" Log plus one of the coefficient to the standard deviation of the observation error when using a mixture distribution robust toward outliers, i.e. when either `inp$robflag = 1` and/or `inp$robflagi = 1`.
- "logitpp" Logit of the proportion of narrow distribution when using a mixture distribution robust toward outliers, i.e. when either `inp$robflag = 1` and/or `inp$robflagi = 1`.

Parameters that can be derived from model parameters:

- "logr" Log of intrinsic growth rate ( $r = 4m/K$ ).
- "logalpha" Proportionality factor for the observation noise of the indices and the biomass process noise:  $sdi = \exp(\logalpha) * sdb$ . (normally set to `logalpha=0`)
- "logbeta" Proportionality factor for the observation noise of the catches and the fishing mortality process noise:  $sdc = \exp(\logbeta) * sdf$ . (this is often difficult to estimate and can result in divergence of the optimisation. Normally set to `logbeta=0`)
- "logBmsy" Log of the equilibrium biomass (Bmsy) when fished at Fmsy.
- "logFmsy" Log of the fishing mortality (Fmsy) leading to the maximum sustainable yield.
- "MSY" The yield when the biomass is at Bmsy and the fishing mortality is at Fmsy, i.e. the maximum sustainable yield.

The above parameter values can be extracted from the `fit.spict()` results using `get.par()`.

Model assumptions

- "1" The intrinsic growth rate ( $r$ ) represents a combination of natural mortality, growth, and recruitment.
- "2" The biomass B\_t refers to the exploitable part of the stock. Estimates in absolute numbers (K, Bmsy, etc.) should be interpreted in light of this.
- "3" The stock is closed to migration.
- "4" Age and size-distribution are stable in time.
- "5" Constant catchability of the gear used to gather information for the biomass index.

**Value**

A result report containing estimates of model parameters, random effects (biomass and fishing mortality), reference points (Fmsy, Bmsy, MSY) including uncertainties given as standard deviations.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
Bmsy <- get.par('logBmsy', rep, exp=TRUE)
summary(rep)
plot(rep)

## End(Not run)
```

---

get.AIC	<i>Calculate AIC from a rep list.</i>
---------	---------------------------------------

---

**Description**

Calculate AIC from a rep list.

**Usage**

```
get.AIC(rep)
```

**Arguments**

rep                      A result report as generated by running fit.spict.

**Value**

AIC

---

get.catchindexoverlap	<i>Find observations of catch and index that overlap</i>
-----------------------	--

---

**Description**

Find observations of catch and index that overlap

**Usage**

```
get.catchindexoverlap(inp)
```

**Arguments**

`inp`                      An input list containing data.

**Value**

List containing overlapping catch (y) and index (z) observations and their time vectors.

---

<code>get.colnms</code>	<i>Get column names for data.frames.</i>
-------------------------	--

---

**Description**

Get column names for data.frames.

**Usage**

`get.colnms()`

**Value**

Vector containing column names of data frames.

---

<code>get.cov</code>	<i>Get covariance matrix of two reported quantities not of fixed model parameters. Covariance of fixed model parameters can be found in <code>rep\$cov.fixed</code>.</i>
----------------------	--

---

**Description**

Get covariance matrix of two reported quantities not of fixed model parameters. Covariance of fixed model parameters can be found in `rep$cov.fixed`.

**Usage**

`get.cov(rep, parname1, parname2, cor = FALSE)`

**Arguments**

`rep`                      Result of `fit.spict()`.  
`parname1`                Name first parameter.  
`parname2`                Name second parameter.  
`cor`                      If TRUE correlation matrix is reported instead of covariance matrix

**Value**

Covariance matrix of specified parameters.

---

get.EBinf	<i>Calculate <math>E(Binfinity)</math> the fished equilibrium.</i>
-----------	--

---

**Description**

If a seasonal pattern in  $F$  is imposed the annual average  $F$  is used for calculating the expectation.

**Usage**

```
get.EBinf(rep)
```

**Arguments**

rep	A result of fit.spict.
-----	------------------------

**Value**

$E(Binf)$ .

---

get.mfrow	<i>Get mfrow from the number of plots to be plotted</i>
-----------	---

---

**Description**

Get mfrow from the number of plots to be plotted

**Usage**

```
get.mfrow(n)
```

**Arguments**

n	Number of plots to be plotted.
---	--------------------------------

**Value**

Nothing

---

get.msyvec	<i>If multiple growth rates (<math>r</math>) are used (e.g. for a seasonal model), return specified reference point for all instances of <math>r</math>.</i>
------------	--

---

### Description

If multiple growth rates ( $r$ ) are used (e.g. for a seasonal model), return specified reference point for all instances of  $r$ .

### Usage

```
get.msyvec(inp, msy)
```

### Arguments

inp	An input list as validated by check.inp().
msy	Matrix containing reference point values as given by get.par().

### Value

A list containing reference point estimates with upper and lower CI bounds.

---

get.order	<i>Get order of printed quantities.</i>
-----------	---

---

### Description

Get order of printed quantities.

### Usage

```
get.order()
```

### Value

Vector containing indices of printed quantities.

---

<code>get.osar.pvals</code>	<i>Check whether ACF of catch and index residuals is significant in any lags.</i>
-----------------------------	---

---

### Description

Check whether ACF of catch and index residuals is significant in any lags.

### Usage

```
get.osar.pvals(rep)
```

### Arguments

<code>rep</code>	Result of <code>fit.spict()</code> , but requires that also residuals have been calculated using <code>calc.osa.resic()</code> .
------------------	--

### Value

Vector of p-values of length equal to the number of data series.

---

<code>get.par</code>	<i>Extract parameters from a result report as generated by <code>fit.spict</code>.</i>
----------------------	--

---

### Description

Extract parameters from a result report as generated by `fit.spict`.

### Usage

```
get.par(parname, rep = rep, exp = FALSE, random = FALSE,
       fixed = FALSE)
```

```
list.quantities(rep)
```

### Arguments

<code>parname</code>	Character string containing the name of the variable of interest.
<code>rep</code>	A result report as generated by running <code>fit.spict</code> .
<code>exp</code>	Take exp of the variable? TRUE/FALSE.
<code>random</code>	DUMMY not used anymore. (Is the variable a random effect? TRUE/FALSE.)
<code>fixed</code>	DUMMY not used anymore. (Is the variable a fixed effect? TRUE/FALSE.)

## Details

`get.par` is a helper function for extracting the value and uncertainty of a specific model parameter, random effect or derived quantity. `list.quantities` gives the names of all quantities.

## Value

`get.par` returns a matrix with four columns containing respectively: 1) the lower 95

## Examples

```
## Make the south Atlantic albacore assessment
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)

## See all quantities that can be extracted
list.quantities(rep)

## Extract the Bmsy reference point
Bmsy <- get.par('logBmsy', rep, exp=TRUE)

## Extract the exploitable biomass estimates
Best <- get.par('logB', rep, exp=TRUE)

## Extract the estimated carrying capacity
K <- get.par('logK', rep, exp=TRUE)

## End(Not run)
```

---

`get.spline`

*Get the values of the seasonal spline for F.*

---

## Description

Get the values of the seasonal spline for F.

## Usage

```
get.spline(logphi, order, dtfine = 1/100)
```

## Arguments

<code>logphi</code>	Values of the phi vector.
<code>order</code>	Order of the spline.
<code>dtfine</code>	Time between points where spline is evaluated.

## Value

Spline values at the points between 0 and 1 with `dtfine` as time step.

---

<code>get.version</code>	<i>Get version of spict including git sha1 version if available.</i>
--------------------------	--

---

**Description**

Get version of spict including git sha1 version if available.

**Usage**

```
get.version(pkg = "spict")
```

**Arguments**

<code>pkg</code>	Name of package.
------------------	------------------

**Value**

Package version

---

<code>guess.m</code>	<i>Use a simple linear regression to guess m (MSY).</i>
----------------------	---

---

**Description**

Use a simple linear regression to guess m (MSY).

**Usage**

```
guess.m(inp, all.return = FALSE)
```

**Arguments**

<code>inp</code>	An input list containing data.
<code>all.return</code>	If true also return a guess on Emsy (effort at MSY) and components of the linear regression.

**Details**

Equations 9.1.7 and 9.1.8 on page 284 of FAO's tropical assessment book are used to guess MSY.

**Value**

The guess on MSY.

---

invlogit	<i>Inverse logit transform.</i>
----------	---------------------------------

---

**Description**

Inverse logit transform.

**Usage**

```
invlogit(a)
```

**Arguments**

a                      Value to take inverse logit of.

**Value**

Inverse logit.

---

invlogp1	<i>Inverse log "plus one" transform</i>
----------	---

---

**Description**

Inverse log "plus one" transform

**Usage**

```
invlogp1(a)
```

**Arguments**

a                      Value to take inverse logp1 of.

**Details**

If  $a = \log(b-1)$ , then the inverse transform is  $b = 1 + \exp(a)$ . Useful for values with lower bound at 1.

**Value**

Inverse logp1.

---

latex.figure	<i>Generate latex code for including a figure.</i>
--------------	--

---

**Description**

Generate latex code for including a figure.

**Usage**

```
latex.figure(figfile, reportfile, caption = "")
```

**Arguments**

figfile	Path to figure file.
reportfile	Path to report file.
caption	This character string will be included as the figure caption.

**Value**

Nothing.

---

likprof.spict	<i>Create profile likelihood</i>
---------------	----------------------------------

---

**Description**

Create profile likelihood

**Usage**

```
likprof.spict(input, verbose = FALSE)
```

**Arguments**

input	A list containing observations and initial values for non profiled parameters (essentially an inp list) with the additional key "likprof" (see details for required keys). A valid result from fit.spict() containing an "inp" key with the described properties is also accepted.
verbose	Print progress to screen.

## Details

The "likprof" list must contain the following keys:

- "pars" A character vector of length equal 1 or 2 containing the name(s) of the parameters to calculate the profile likelihood for.
- "parrange" A vector containing the parameter range(s) to profile over: `parrange = c(min(par1), max(par1), min(par2), max(par2))`.

Optional:

- "nogridpoints" Number of grid points to evaluate the profile likelihood for each parameter. Default: 9. Note: with two parameters the calculation time increases quadratically when increasing the number of gridpoints.

## Value

The output is the input with the likelihood profile information added to the `likprof` key of either `inp` or `rep$inp`.

## Examples

```
## Not run:
data(pol)
inp <- pol$albacore
inp$likprof <- list()
inp$likprof$pars <- 'logK'
inp$likprof$parrange <- c(log(80), log(400))
inp$likprof$nogridpoints <- 15
rep <- fit.spict(inp)
rep <- likprof.spict(rep)
plotspict.likprof(rep, logpar=TRUE)

## End(Not run)
```

---

`list.possible.priors`    *List parameters to which priors can be added*

---

## Description

List parameters to which priors can be added

## Usage

```
list.possible.priors()
```

## Value

Prints parameters to which priors can be added.

---

make.datin	<i>Create data list used as input to TMB::MakeADFun.</i>
------------	--

---

### Description

Create data list used as input to TMB::MakeADFun.

### Usage

```
make.datin(inp, dbg = 0)
```

### Arguments

inp	List of input variables as output by check.inp.
dbg	Debugging option. Will print out runtime information useful for debugging if set to 1.

### Value

List to be used as data input to TMB::MakeADFun.

---

make.ellipse	<i>Calculate confidence ellipsis.</i>
--------------	---------------------------------------

---

### Description

Calculates the confidence ellipsis of two reported model parameters. This is particularly useful as a detailed view of the uncertainty of two correlated parameters.

### Usage

```
make.ellipse(inds, rep)
```

### Arguments

inds	Indices of the two reported model parameters.
rep	A result report as generated by running fit.spict.

### Value

A matrix with two columns containing the x and y coordinates of the ellipsis.

---

make.ffacvec	<i>Make ffac vector</i>
--------------	-------------------------

---

**Description**

Make ffac vector

**Usage**

```
make.ffacvec(inp, ffac)
```

**Arguments**

inp	Input list
ffac	Factor to multiply current F by

**Value**

Input list containing ffacvec

---

make.obj	<i>Create TMB obj using TMB::MakeADFun and squelch screen printing.</i>
----------	---

---

**Description**

Create TMB obj using TMB::MakeADFun and squelch screen printing.

**Usage**

```
make.obj(datin, pl, inp, phase = 1)
```

**Arguments**

datin	Data list.
pl	Parameter list.
inp	List of input variables as output by check.inp.
phase	Estimation phase, integer.

**Value**

List to be used as data input to TMB.

---

make.report	<i>Creates a pdf file containing the summary output and result plots</i>
-------------	--

---

### Description

This function probably works probably only in linux with a LaTeX distribution installed (pdflatex).

### Usage

```
make.report(rep, reporttitle = "", reportfile = "report.tex",
  summaryoutfile = "summaryout.txt", outdir = ".",
  keep.figurefiles = FALSE, keep.txtfiles = FALSE,
  keep.texfiles = FALSE)
```

### Arguments

rep	A valid result from fit.spict with OSA residuals.
reporttitle	This character string will be printed as the first line of the report.
reportfile	character, filename (ending in '.tex') of the report LaTeX file.
summaryoutfile	character, filename of the summary output file.
outdir	character, directory where all output files are going to be saved.
keep.figurefiles	If TRUE generated figure files will not be cleaned up.
keep.txtfiles	If TRUE generated txt files will not be cleaned up.
keep.texfiles	If TRUE generated tex file will not be cleaned up.

### Value

Nothing.

---

make.rpellipse	<i>Calculate confidence ellipsis for reference points.</i>
----------------	--

---

### Description

Calculates the confidence ellipsis of logBmsy and logFmsy (last if multiple)

### Usage

```
make.rpellipse(rep)
```

### Arguments

rep	A result report as generated by running fit.spict.
-----	--

**Value**

A matrix with two columns containing the x and y coordinates of the ellipsis.

---

make.splinemat	<i>Make a spline design matrix</i>
----------------	------------------------------------

---

**Description**

Make a spline design matrix

**Usage**

```
make.splinemat(nseasons, order, dtfine = 1/100)
```

**Arguments**

nseasons	Number of seasons
order	Order of the spline
dtfine	Time between points where spline is evaluated

**Value**

Spline design matrix.

---

man.cols	<i>Load color of management scenarios.</i>
----------	--

---

**Description**

Load color of management scenarios.

**Usage**

```
man.cols()
```

**Value**

Color vector

---

manage

---

*Calculate predictions under different management scenarios*

---

## Description

Calculate predictions under different management scenarios

## Usage

```
manage(repin, scenarios = "all", manstart = NULL, dbg = 0,
       catch = NULL, catchList = NULL)
```

## Arguments

<code>repin</code>	Result list from <code>fit.spict()</code> .
<code>scenarios</code>	Vector of integers specifying which scenarios to run. Default: 'all'.
<code>manstart</code>	Year that management should be initiated.
<code>dbg</code>	Debug flag, <code>dbg=1</code> some output, <code>dbg=2</code> more output.
<code>catch</code>	numeric, take that catch in scenario 1, Ignored if <code>catchList</code> is specified.
<code>catchList</code>	list with <code>timeC</code> and <code>obsC</code> numeric vectors giving the starting times and catches to take in scenario 1.

## Details

Scenarios that are currently implemented include:

- "1" Keep the catch of the current year (i.e. the last observed catch).
- "2" Keep the  $F$  of the current year.
- "3" Fish at  $F_{msy}$  i.e.  $F=F_{msy}$ .
- "4" No fishing, reduce to 1% of current  $F$ .
- "5" Reduce  $F$  by  $X\%$ . Default  $X = 25$ .
- "6" Increase  $F$  by  $X\%$ . Default  $X = 25$ .
- "7" Use ICES MSY advice rule.

Scenario 7 implements the ICES MSY advice rule for stocks that are assessed using `spict` (ICES 2017).  $MSY\ B\_trigger$  is set equal to  $B_{MSY} / 2$ . Then fishing mortality in the short forecast is calculated as:

$$F(y+1) = F(y) * \min(1, \text{median}[B(y+1) / MSY\ B\_trigger] / \text{median}[F(y)/F_{MSY}])$$

## Value

List containing results of management calculations.

## References

ICES. 2017. Report of the Workshop on the Development of the ICES approach to providing MSY advice for category 3 and 4 stocks (WKMSYCat34), 6–10 March 2017, Copenhagen, Denmark. ICES CM 2017/ ACOM:47. 53 pp.

## Examples

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
repman <- manage(rep)
mansummary(repman) # To print projections

## End(Not run)
```

---

<code>mansummary</code>	<i>Print management summary.</i>
-------------------------	----------------------------------

---

## Description

Print management summary.

## Usage

```
mansummary(repin, ypred = 1, include.EBinf = FALSE,
  include.unc = TRUE, verbose = TRUE)
```

## Arguments

<code>repin</code>	Result list as output from <code>manage()</code> .
<code>ypred</code>	Show results for <code>ypred</code> years from <code>manstart</code> .
<code>include.EBinf</code>	Include <code>EBinf/Bmsy</code> in the output.
<code>include.unc</code>	Include uncertainty of management quantities.
<code>verbose</code>	Print more details on observed and predicted time intervals.

## Value

Data frame containing management summary.

---

meanvar2shaperate	<i>Convert mean and variance to shape and rate of gamma distribution</i>
-------------------	--

---

**Description**

Convert mean and variance to shape and rate of gamma distribution

**Usage**

```
meanvar2shaperate(mean, var)
```

**Arguments**

mean	Mean value.
var	Variance.

**Value**

Vector containing shape and rate parameters.

---

plot.col	<i>Plot model points colored depending on the quarter to which they belong.</i>
----------	---

---

**Description**

Plot model points colored depending on the quarter to which they belong.

**Usage**

```
## S3 method for class 'col'
plot(time, obs, obsx = NULL, pch = 1, add = FALSE,
     typ = "p", do.line = TRUE, add.legend = FALSE,
     add.vline.at = NULL, ...)
```

**Arguments**

time	Time vector.
obs	Observation vector (or residual vector).
obsx	Second observation vector for use as independent variable instead of time.
pch	Point character.
add	If TRUE plot is added to the current plot.
typ	Plot type.

do.line	If TRUE draw a line between points.
add.legend	If TRUE add legend containing information on quarters.
add.vline.at	If not NULL will draw a vertical line at the given time point.
...	Additional plotting arguments.

**Value**

Nothing.

---

plot.spictcls	<i>Plot summarising spict results.</i>
---------------	--

---

**Description**

Plot summarising spict results.

**Usage**

```
## S3 method for class 'spictcls'
plot(x, stamp = get.version(), ...)
```

**Arguments**

x	A result report as generated by running fit.spict.
stamp	character,
...	additional arguments affecting the summary produced.

**Details**

Create a plot containing the following:

- 1. Estimated biomass using plotspict.biomass().
- 2. Estimated fishing mortality using plotspict.f().
- 3. Observed versus predicted catches using plotspict.catch().
- 4. Estimated biomass relative to Bmsy using plotspict.bbmsy().
- 5. Estimated fishing mortality relative to Fmsy using plotspict.ffmsy().
- 6. Estimated F versus estimated B using plotspict.fb().
- 7. Observed versus theoretical production using plotspict.production().

Optional plots included if relevant:

- Estimated seasonal spline using plotspict.season().
- Calculated time-constant using plotspict.tc().
- First prior and corresponding posterior distribution using plotspict.priors().
- One-step-ahead residuals of catches using plotspict.osar().
- One-step-ahead residuals of catches using plotspict.osar().

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plot(rep)

## End(Not run)
```

---

plotmm.priors	<i>Plot priors of Meyer &amp; Millar model</i>
---------------	--

---

**Description**

Plot priors of Meyer & Millar model

**Usage**

```
plotmm.priors(nm, priorsin, add = TRUE, ...)
```

**Arguments**

nm	Name of prior
priorsin	List of priors, typically in <code>inp\$meylemillar\$priors</code> .
add	If TRUE add to current plot.
...	Additional arguments to plot.

**Value**

Nothing.

---

plotspict.bbmsy	<i>Plot estimated B/Bmsy.</i>
-----------------	-------------------------------

---

**Description**

Plot estimated B/Bmsy.

**Usage**

```
plotspict.bbmsy(rep, logax = FALSE, main = "Relative biomass",
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE, lineat = 1,
  xlab = "Time", stamp = get.version(), add = FALSE)
```

**Arguments**

<code>rep</code>	A result report as generated by running <code>fit.spict</code> .
<code>logax</code>	Take log of y-axis? default: FALSE
<code>main</code>	Title of plot.
<code>ylim</code>	Limits for y-axis.
<code>plot.obs</code>	If TRUE observations are plotted.
<code>qlegend</code>	If TRUE legend explaining colours of observation data is plotted.
<code>lineat</code>	Draw horizontal line at this y-value.
<code>xlab</code>	Label of x-axis.
<code>stamp</code>	Stamp plot with this character string.
<code>add</code>	Logical, if TRUE adds lines to an existing plot.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.bbmsy(rep)

## End(Not run)
```

---

<code>plotspict.biomass</code>	<i>Plot estimated biomass.</i>
--------------------------------	--------------------------------

---

**Description**

Plots estimated biomass, Bmsy with confidence limits.

**Usage**

```
plotspict.biomass(rep, logax = FALSE, main = "Absolute biomass",
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE, xlab = "Time",
  ylab = NULL, rel.axes = TRUE, rel.ci = TRUE,
  stamp = get.version())
```

**Arguments**

<code>rep</code>	A result report as generated by running <code>fit.spict</code> .
<code>logax</code>	Take log of y-axis? default: FALSE
<code>main</code>	Title of plot.
<code>ylim</code>	Limits for y-axis.
<code>plot.obs</code>	If TRUE observations are plotted.
<code>qlegend</code>	If TRUE legend explaining colours of observation data is plotted.
<code>xlab</code>	Label of x-axis.
<code>ylab</code>	Label of y-axis.
<code>rel.axes</code>	Plot secondary y-axis containing relative level of F.
<code>rel.ci</code>	Plot confidence interval for relative level of F.
<code>stamp</code>	Stamp plot with this character string.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.biomass(rep)

## End(Not run)
```

---

<code>plotspict.btrend</code>	<i>Plot the expected biomass trend</i>
-------------------------------	--

---

**Description**

Plot the expected biomass trend

**Usage**

```
plotspict.btrend(rep)
```

**Arguments**

<code>rep</code>	A result report as generated by running <code>fit.spict</code> .
------------------	--

**Value**

Nothing.

---

plotspict.catch	<i>Plot observed catch and predictions.</i>
-----------------	---

---

## Description

Plots observed catch and predictions using the current  $F$  and  $F_{msy}$ . The plot also contains the equilibrium catch if the current  $F$  is maintained.

## Usage

```
plotspict.catch(rep, main = "Catch", ylim = NULL, qlegend = TRUE,  
  lcol = "blue", xlab = "Time", ylab = NULL, stamp = get.version())
```

## Arguments

rep	A result report as generated by running fit.spict.
main	Title of plot.
ylim	Limits for y-axis.
qlegend	If TRUE legend explaining colours of observation data is plotted.
lcol	Colour of prediction lines.
xlab	Label of x-axis.
ylab	Label of y-axis.
stamp	Stamp plot with this character string.

## Value

Nothing.

## Examples

```
## Not run:  
data(pol)  
rep <- fit.spict(pol$albacore)  
plotspict.catch(rep)  
  
## End(Not run)
```

---

plotspict.ci	<i>Plot catch and index data.</i>
--------------	-----------------------------------

---

**Description**

Plot catch and index data.

**Usage**

```
plotspict.ci(inp, stamp = get.version())
```

**Arguments**

inp	An input list containing data.
stamp	Stamp plot with this character string.

**Value**

Nothing

---

plotspict.data	<i>Plot input data</i>
----------------	------------------------

---

**Description**

Plot input data

**Usage**

```
plotspict.data(inpin, MSY = NULL, one.index = NULL, qlegend = TRUE,
  stamp = get.version())
```

**Arguments**

inpin	An input list containing data.
MSY	Value of MSY.
one.index	Integer indicating the number of the index to plot.
qlegend	If TRUE legend explaining colours of observation data is plotted.
stamp	Stamp plot with this character string.

**Value**

Nothing

---

`plotspict.diagnostic`    *Plot model diagnostic (data, residuals, and more)*

---

## Description

Plot model diagnostic (data, residuals, and more)

## Usage

```
plotspict.diagnostic(rep, lag.max = 4, qlegend = TRUE,
  plot.data = TRUE, mfcol = FALSE, stamp = get.version())
```

## Arguments

<code>rep</code>	A result report as generated by running <code>fit.spict</code> .
<code>lag.max</code>	Maximum lag to use in acf calculations.
<code>qlegend</code>	If TRUE plot a legend showing quarter of year information.
<code>plot.data</code>	If TRUE plot data in the top row (this option is only applied if <code>osa</code> residuals have been calculated).
<code>mfcol</code>	If TRUE plot plots columnwise (FALSE = rowwise).
<code>stamp</code>	Stamp plot with this character string.

## Value

Nothing.

## Examples

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.diagnostic(rep)

## End(Not run)
```

---

`plotspict.f`    *Plot estimated fishing mortality.*

---

## Description

Plots estimated fishing mortality with `Fmsy` and associated confidence interval.

**Usage**

```
plotspict.f(rep, logax = FALSE, main = "Absolute fishing mortality",
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE, xlab = "Time",
  ylab = NULL, rel.axes = TRUE, rel.ci = TRUE,
  stamp = get.version())
```

**Arguments**

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
plot.obs	If TRUE observations are plotted.
qlegend	If TRUE legend explaining colours of observation data is plotted.
xlab	Label of x-axis.
ylab	Label of y-axis.
rel.axes	Plot secondary y-axis containing relative level of F.
rel.ci	Plot confidence interval for relative level of F.
stamp	Stamp plot with this character string.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.f(rep)

## End(Not run)
```

---

plotspict.fb

---

*Plot fishing mortality versus biomass.*

---

**Description**

Plots estimated fishing mortality as a function of biomass together with reference points and the prediction for next year given a constant F. The equilibrium biomass for F fixed to the current value is also plotted.

**Usage**

```
plotspict.fb(rep, logax = FALSE, plot.legend = TRUE,
  man.legend = TRUE, ext = TRUE, rel.axes = FALSE, xlim = NULL,
  ylim = NULL, labpos = c(1, 1), xlabel = NULL,
  stamp = get.version())
```

**Arguments**

rep	A result report as generated by running fit.spict.
logax	Take log of x and y-axes? default: FALSE
plot.legend	Plot legend explaining triangle.
man.legend	Plot legend explaining management scenarios..
ext	Add relative level axis to top and right side.
rel.axes	Plot axes in relative levels instead of absolute.
xlim	Limits of x-axis.
ylim	Limits of y-axis.
labpos	Positions of time stamps of start and end points as in pos in text().
xlabel	Label of x-axis. If NULL not used.
stamp	Stamp plot with this character string.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.fb(rep)

## End(Not run)
```

---

plotspict.ffmsy

---

*Plot estimated relative fishing mortality.*

---

**Description**

Plots estimated fishing mortality with Fmsy and associated confidence interval.

**Usage**

```
plotspict.ffmsy(rep, logax = FALSE,
  main = "Relative fishing mortality", ylim = NULL, plot.obs = TRUE,
  qlegend = TRUE, lineat = 1, xlab = "Time", stamp = get.version(),
  add = FALSE)
```

**Arguments**

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
plot.obs	If TRUE observations are plotted.
qlegend	If TRUE legend explaining colours of observation data is plotted.
lineat	Draw horizontal line at this y-value.
xlab	Label of x-axis.
stamp	Stamp plot with this character string.
add	Logical, if TRUE adds lines to an existing plot.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.ffmsy(rep)

## End(Not run)
```

---

plotspict.growth	<i>Plot estimated time-varying growth</i>
------------------	---

---

**Description**

Plot estimated time-varying growth

**Usage**

```
plotspict.growth(rep, logax = FALSE, main = "Time-varying growth",
  ylim = NULL, xlim = NULL, xlab = "Time", plot.ci = TRUE,
  stamp = get.version())
```

**Arguments**

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.

xlim	Limits for x-axis.
xlab	Label of x-axis.
plot.ci	If TRUE 95% CIs are included.
stamp	Stamp plot with this character string.

**Value**

Nothing.

---

plotspict.infl	<i>Plots influence statistics of observations.</i>
----------------	--

---

**Description**

Plots influence statistics of observations.

**Usage**

```
plotspict.infl(rep, stamp = get.version())
```

**Arguments**

rep	A valid result from calc.influence().
stamp	Stamp plot with this character string.

**Value**

Nothing.

---

plotspict.inflsum	<i>Plots summary of influence statistics of observations.</i>
-------------------	---

---

**Description**

Plots summary of influence statistics of observations.

**Usage**

```
plotspict.inflsum(rep, stamp = get.version())
```

**Arguments**

rep	A valid result from calc.influence().
stamp	Stamp plot with this character string.

**Value**

Nothing.

---

plotspict.likprof	<i>Plots result of likelihood profiling.</i>
-------------------	--

---

**Description**

Plots result of likelihood profiling.

**Usage**

```
plotspict.likprof(input, logpar = FALSE, stamp = get.version())
```

**Arguments**

input	Result of running likprof.spict().
logpar	If TRUE log of parameters are shown.
stamp	Stamp plot with this character string.

**Value**

Nothing but shows a plot.

---

plotspict.osar	<i>Plot one-step-ahead residuals</i>
----------------	--------------------------------------

---

**Description**

Plots observed versus predicted catches.

**Usage**

```
plotspict.osar(rep, collapse.I = TRUE, qlegend = TRUE)
```

**Arguments**

rep	A result report as generated by running fit.spict.
collapse.I	Collapse index residuals into one plot. Default: TRUE.
qlegend	Plot legend for quarters.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.osar(rep)

## End(Not run)
```

---

plotspict.priors	<i>Plot priors and posterior distribution.</i>
------------------	--

---

**Description**

Plot priors and posterior distribution.

**Usage**

```
plotspict.priors(rep, do.plot = 4, stamp = get.version())
```

**Arguments**

rep	A result from fit.spict.
do.plot	Integer defining maximum number of priors to plot.
stamp	Stamp plot with this character string.

**Value**

Nothing

---

plotspict.production	<i>Plot theoretical production curve and estimates.</i>
----------------------	---

---

**Description**

Plots the theoretical production curve (production as a function of biomass) as calculated from the estimated model parameters. Overlaid is the estimated production/biomass trajectory.

**Usage**

```
plotspict.production(rep, n.plotyears = 40, main = "Production curve",
  stamp = get.version())
```

**Arguments**

<code>rep</code>	A result report as generated by running <code>fit.spict</code> .
<code>n.plotyears</code>	Plot years next to points if number of points is below <code>n.plotyears</code> . Default: 40.
<code>main</code>	Title of plot.
<code>stamp</code>	Stamp plot with this character string.

**Value**

Nothing.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.production(rep)

## End(Not run)
```

---

<code>plotspict.retro</code>	<i>Plot results of retrospective analysis</i>
------------------------------	---

---

**Description**

Plot results of retrospective analysis

**Usage**

```
plotspict.retro(rep, stamp = get.version())
```

**Arguments**

<code>rep</code>	A valid result from <code>fit.spict</code> .
<code>stamp</code>	Stamp plot with this character string.

**Value**

Nothing

---

plotspict.season	<i>Plot the mean F cycle</i>
------------------	------------------------------

---

**Description**

If seasonal data are available the seasonal cycle in the fishing mortality can be estimated. This function plots this mean F cycle.

**Usage**

```
plotspict.season(rep, stamp = get.version())
```

**Arguments**

rep	A result report as generated by running fit.spict.
stamp	Stamp plot with this character string.

**Value**

Nothing.

---

plotspict.tc	<i>Plot time constant.</i>
--------------	----------------------------

---

**Description**

Plots the time required for the biomass to reach a certain proportion of Bmsy. The time required to reach 95% of Bmsy is highlighted.

**Usage**

```
plotspict.tc(rep, main = "Time to Bmsy", stamp = get.version())
```

**Arguments**

rep	A result report as generated by running fit.spict.
main	Title of plot.
stamp	Stamp plot with this character string.

**Value**

Nothing.

### Examples

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.tc(rep)

## End(Not run)
```

---

pol

*Fisheries data included in Polacheck et al. (1993).*

---

### Description

Fisheries data for south Atlantic albacore, northern Namibian hake, and New Zealand rock lobster.

### Usage

```
data(pol)
```

### Format

Data are lists containing data and initial values for estimation formatted to be used as an input to `fit.spict()`.

### Source

Polacheck et al. (1993), Canadian Journal of Fisheries and Aquatic Science, vol 50, pp. 2597-2607.

### Examples

```
## Not run:
data(pol)
rep <- fit.spict(inp=pol$albacore)
rep <- fit.spict(inp=pol$hake)
rep <- fit.spict(inp=pol$lobster)

## End(Not run)
```

---

pred.catch	<i>Predict the catch of the prediction interval specified in inp</i>
------------	--

---

**Description**

Predict the catch of the prediction interval specified in inp

**Usage**

```
pred.catch(repin, fmsyfac = 1, get.sd = FALSE, exp = FALSE,
           dbg = 0)
```

**Arguments**

repin	Result list as output from fit.spict().
fmsyfac	Projection are made using $F = \text{fmsyfac} * F_{\text{msy}}$ .
get.sd	Get uncertainty of the predicted catch.
exp	If TRUE report exp of log predicted catch.
dbg	Debug flag, dbg=1 some output, dbg=2 more ourput.

**Value**

A vector containing predicted catch (possibly with uncertainty).

---

predict.b	<i>Helper function for sim.spict()</i>
-----------	--

---

**Description**

Helper function for sim.spict()

**Usage**

```
## S3 method for class 'b'
predict(B0, F0, gamma, m, K, n, dt, sdb, btype)
```

**Arguments**

B0	Initial biomass.
F0	Fishing mortality.
gamma	gamma parameter in Fletcher's Pella-Tomlinson formulation.
m	m parameter in Fletcher's Pella-Tomlinson formulation.
K	Carrying capacity.

n	Pella-Tomlinson exponent.
dt	Time step.
sdb	Standard deviation of biomass process.
btype	If 'lamperti' use Lamperti transformed equation, if 'naive' use naive formulation.

### Value

Predicted biomass at the end of dt.

---

predict.logf	<i>Helper function for sim.spict()</i>
--------------	--

---

### Description

Helper function for sim.spict()

### Usage

```
## S3 method for class 'logf'
predict(logF0, dt, sdf, efforttype)
```

### Arguments

logF0	Fishing mortality.
dt	Time step.
sdf	Standard deviation of F process.
efforttype	If 1 use diffusion on logF, if 2 use diffusion of F with state dependent noise (this induces the drift term $-0.5*sdf^2$ in log domain)

### Value

Predicted F at the end of dt.

---

predict.logmre	<i>Helper function for sim.spict()</i>
----------------	--

---

**Description**

Helper function for sim.spict()

**Usage**

```
## S3 method for class 'logmre'
predict(logmre0, dt, sdm, psi, logm)
```

**Arguments**

logmre0	Initial value
dt	Time step.
sdm	Standard deviation of mre process.
psi	Degree of attraction toward mean.
logm	Mean logm.

**Value**

Predicted mre at the end of dt.

---

print.spictcls	<i>Output a summary of a fit.spict() run.</i>
----------------	---

---

**Description**

Output a summary of a fit.spict() run.

**Usage**

```
## S3 method for class 'spictcls'
print(x, ...)
```

**Arguments**

x	A result report as generated by running fit.spict.
...	additional arguments affecting the summary produced.

**Value**

Nothing.

---

prop.F	<i>Calculate management for changing F by a given factor.</i>
--------	---

---

**Description**

Calculate management for changing F by a given factor.

**Usage**

```
prop.F(fac, inpin, repin, maninds, corF = FALSE, dbg = 0)
```

**Arguments**

fac	Factor to multiply current F with.
inpin	Input list.
repin	Results list.
maninds	Indices of time vector for which to apply management.
corF	Make correction to F process such that the drift $(-0.5*sdf^2*dt)$ is cancelled and F remains constant in projection mode
dbg	Debug flag, dbg=1 some output, dbg=2 more ourput.

**Value**

List containing results of management calculations.

---

put.xax	<i>Adds the x-axis to influence plots</i>
---------	---

---

**Description**

Adds the x-axis to influence plots

**Usage**

```
put.xax(rep)
```

**Arguments**

rep	A valid result from calc.influence().
-----	---------------------------------------

**Value**

Nothing.

---

read.aspic	<i>Reads ASPIC input file.</i>
------------	--------------------------------

---

**Description**

Reads an input file following the ASPIC 7 format described in the ASPIC manual (found here <http://www.mhprager.com/aspic.html>).

**Usage**

```
read.aspic(filename)
```

**Arguments**

filename	Path of the ASPIC input file.
----------	-------------------------------

**Value**

A list of input variables that can be used as input to `fit.spict()`.

**Examples**

```
## Not run:
filename <- 'YFT-SSE.a7inp' # or some other ASPIC 7 input file
inp <- read.aspic(filename)
rep <- fit.spict(inp)
summary(rep)
plot(rep)

## End(Not run)
```

---

read.aspic.res	<i>Reads the parameter estimates of an Aspic result file.</i>
----------------	---

---

**Description**

Reads the parameter estimates of an Aspic result file.

**Usage**

```
read.aspic.res(filename)
```

**Arguments**

filename	Name of the Aspic result file to read
----------	---------------------------------------

**Value**

Vector containing the parameter estimates.

---

refpointci	<i>Draw CI around a reference point using polygon</i>
------------	---

---

### Description

Draw CI around a reference point using polygon

### Usage

```
refpointci(t, ll, ul, cicol = "ivory2")
```

### Arguments

t	Time vector.
ll	Lower limit.
ul	Upper limit.
cicol	Colour of polygon

### Value

Spline design matrix.

---

res.diagn	<i>Helper function for calc.osar.resid that calculates residual statistics.</i>
-----------	---

---

### Description

Helper function for calc.osar.resid that calculates residual statistics.

### Usage

```
res.diagn(resid, id, name = "")
```

### Arguments

resid	Residuals from either catches or indices.
id	Identifier for residuals e.g. "C".
name	Identifier that will be used in warning messages.

### Value

List containing residual statistics in 'diagn', shapiro output in 'shapiro', and bias output in 'bias'.

---

retro	<i>Conduct retrospective analysis</i>
-------	---------------------------------------

---

### Description

A retrospective analysis consists of estimating the model with later data points removed sequentially one year at a time.

### Usage

```
retro(rep, nretroyear = 5)
```

### Arguments

rep	A valid result from fit.spict.
nretroyear	Number of years of data to remove (this is also the total number of model runs).

### Value

A rep list with the added key retro containing the results of the retrospective analysis. Use plotspict.retro() to plot these results.

### Examples

```
## Not run:
data(pol)
inp <- pol$albacore
rep <- fit.spict(inp)
rep <- retro(rep, nretroyear=6)
plotspict.retro(rep)

## End(Not run)
```

---

season.cols	<i>Load season colors.</i>
-------------	----------------------------

---

### Description

Load season colors.

### Usage

```
season.cols(modin)
```

### Arguments

modin	Time vector modulo 1.
-------	-----------------------

**Value**

Vector containing season colors.

---

shaperate2meanvar	<i>Convert shape and rate of gamma distribution to mean and variance</i>
-------------------	--

---

**Description**

Convert shape and rate of gamma distribution to mean and variance

**Usage**

```
shaperate2meanvar(shape, rate)
```

**Arguments**

shape	Shape parameter
rate	Rate parameter (scale = 1/rate).

**Value**

Vector containing mean and var parameters.

---

sim.spict	<i>Simulate data from Pella-Tomlinson model</i>
-----------	---

---

**Description**

Simulates data using either manually specified parameters values or parameters estimated by fit.spict()

**Usage**

```
sim.spict(input, nobs = 100)
```

**Arguments**

input	Either an inp list with an ini key (see ?check.inp) or a rep list where rep is the output of running fit.spict().
nobs	Optional specification of the number of simulated observations.

## Details

Manual specification: To specify parameters manually use the `inp$ini` format similar to when specifying initial values for running `fit.spict()`. Observations can be simulated at specific times using `inp$timeC` and `inp$timeI`. If these are not specified then the length of `inp$obsC` or `inp$obsI` is used to determine the number of observations of catches and indices respectively. If none of these are specified then `nobs` observations of catch and index will be simulated evenly distributed in time.

Estimated parameters: Simply take the output from a `fit.spict()` run and use as input to `sim.spict()`.

## Value

A list containing the simulated data.

## Examples

```
## Not run:
data(pol)
repin <- fit.spict(pol$albacore)
# Simulate a specific number of observations
inp <- list()
inp$dteuler <- 1/4 # To reduce calculation time
inp$ini <- repin$inp$ini
inp$ini$logF <- NULL
inp$ini$logB <- NULL
set.seed(1)
sim <- sim.spict(inp, nobs=150)
repsim <- fit.spict(sim)
summary(repsim) # Note true values are listed in the summary
plot(repsim) # Note true states are shown with orange colour

# Simulate data with seasonal F
inp <- list()
inp$dteuler <- 1/4
inp$nseasons <- 2
inp$splineorder <- 1
inp$obsC <- 1:80
inp$obsI <- 1:80
inp$ini <- repin$inp$ini
inp$ini$logF <- NULL
inp$ini$logB <- NULL
inp$ini$logphi <- log(2) # Seasonality introduced here
inp <- check.inp(inp)
sim2 <- sim.spict(inp)
par(mfrow=c(2, 1))
plot(sim2$obsC, typ='l')
plot(sim2$obsI[[1]], typ='l')

## End(Not run)
```

---

spict

*Fits a continuous-time surplus production model to data*

---

### Description

Fits a continuous-time surplus production model to data

### Author(s)

Martin W. Pedersen <mawp@dtu.dk>

### References

<https://github.com/mawp/spict/>

### Examples

```
## Not run:
rep <- test.spict()

## End(Not run)
```

---

spict2DLMtool

*Get function to estimate TAC for the DLMtool package*

---

### Description

Get function to estimate TAC for the DLMtool package

### Usage

```
spict2DLMtool(fractileC = 0.5, fractileFFmsy = 0.5,
  fractileBBmsy = 0.5, uncertaintyCap = FALSE, lower = 0.8,
  upper = 1.2, env = globalenv())
```

### Arguments

fractileC	The fractile of the catch distribution to be used for setting TAC. Default is median (0.5).
fractileFFmsy	The fractile of the distribution of F/Fmsy. Default is 0.5 (median).
fractileBBmsy	The fractile of the distribution of B/Bmsy. Default is 0.5 (median).

<b>uncertaintyCap</b>	Logical; If true TAC is bound between two values set in lower and upper. Default: FALSE.
<b>lower</b>	lower bound of the uncertainty cap. Default is 0.8, used if uncertaintyCap = TRUE.
<b>upper</b>	upper bound of the uncertainty cap. Default is 1.2, used if uncertaintyCap = TRUE.
<b>env</b>	environment where the harvest control rule function(s) are assigned to.

## Details

This function creates harvest control rules (HCRs) which can be incorporated into a management strategy evaluation framework (DLMtool package). HCRs are saved with a generic name to the global environment and name of HCR is returned if results of the function are assigned to an object. HCR runs a SPiCT assessment using catch and relative biomass index observations and stock status estimates are used to set the TAC for the next year. TAC can be based on the distribution of predicted catches (percentileC) and/or the distribution of the Fmsy reference level (percentileFmsy). Additionally, a cap can be applied to account for low biomass levels (below Bmsy). Arguments of returned function are 'x' - the position in a data-limited methods data object, 'Data' - the data-limited methods data object (see DLMtool), and 'reps' - the number of stochastic samples of the TAC recommendation (not used for this HCR). One or several arguments of the function can be provided as vectors to generate several HCRs at once (several vectors have to have same length).

## Value

A function which can estimate TAC recommendations based on SPiCT assessment, taking assessment uncertainty into account.

## Examples

```
## Not run:
library(DLMtool)

## Put together an operating model from the available DLM toolkit examples
StockEx <- Herring
FleetEx <- Generic_IncE
ObsEx <- Precise_Unbiased

## Remove changes in life history parameters
StockEx@Mgrad <- c(0,0)
StockEx@Kgrad <- c(0,0)
StockEx@Linfggrad <- c(0,0)
StockEx@Prob_staying <- c(1,1)

## Set the depletion level
StockEx@D <- c(0.3, 0.4)

## create Operation Model
OMex <- new("OM", Stock = StockEx, Fleet = FleetEx,
            Obs = ObsEx)
```

```
## Set simulation options
OMex@nsim <- 10
OMex@years <- 25
OMex@proyears <- 5
## Get SPiCT HCR
MPname <- spict2DLMtool(fractileC=0.3)

## run MSE
MSEex <- runMSE(OMex,
               MPs = MPname,
               timelimit = 150,
               CheckMPs = FALSE)
## example plot of results
Pplot2(MSEex, traj="quant", quants=c(0.2, 0.8))

## End(Not run)
```

---

**spictcls**

*An S4 class to represent output from a SPiCT fit.*

---

## Description

An S4 class to represent output from a SPiCT fit.

---

**summary.spictcls**

*Output a summary of a fit.spict() run.*

---

## Description

The output includes the parameter estimates with 95

## Usage

```
## S3 method for class 'spictcls'
summary(object, ...)
```

## Arguments

<b>object</b>	A result report as generated by running fit.spict.
<b>...</b>	additional arguments affecting the summary produced.

## Value

Nothing. Prints a summary to the screen.

**Examples**

```
## Not run:
data(pol)
rep <- fit.spict(pol$albacore)
summary(rep)

## End(Not run)
```

---

sumspict.diagnostics    *Diagnostics table*

---

**Description**

Diagnostics table

**Usage**

```
sumspict.diagnostics(rep, ndigits = 8)
```

**Arguments**

**rep**                    A result report as generated by running fit.spict.  
**ndigits**                Present values with this number of digits after the dot.

**Value**

data.frame containing diagnostics information.

---

sumspict.drefpoints    *Deterministic reference points of a fit.spict() run.*

---

**Description**

Deterministic reference points of a fit.spict() run.

**Usage**

```
sumspict.drefpoints(rep, ndigits = 8)
```

**Arguments**

**rep**                    A result report as generated by running fit.spict.  
**ndigits**                Present values with this number of digits after the dot.

**Value**

data.frame containing deterministic reference points.

---

sumspict.fixedpars	<i>Fixed parameters table.</i>
--------------------	--------------------------------

---

### Description

Fixed parameters table.

### Usage

```
sumspict.fixedpars(rep, ndigits = 8)
```

### Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

### Value

data.frame containing fixed parameter information.

---

sumspict.ini	<i>Sensitivity to the initial parameter values</i>
--------------	--

---

### Description

Sensitivity to the initial parameter values

### Usage

```
sumspict.ini(rep, numdigits)
```

### Arguments

rep	A result report as generated by running fit.spict.
numdigits	Present values with this number of digits after the dot.

### Value

list containing diagnostics information.

---

sumspict.parest	<i>Parameter estimates of a fit.spict() run.</i>
-----------------	--

---

**Description**

Parameter estimates of a fit.spict() run.

**Usage**

```
sumspict.parest(rep, ndigits = 8)
```

**Arguments**

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

**Value**

data.frame containing parameter estimates.

---

sumspict.predictions	<i>Predictions of a fit.spict() run.</i>
----------------------	--

---

**Description**

Predictions of a fit.spict() run.

**Usage**

```
sumspict.predictions(rep, ndigits = 8)
```

**Arguments**

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

**Value**

data.frame containing predictions.

---

sumspict.priors	<i>Fixed parameters table.</i>
-----------------	--------------------------------

---

**Description**

Fixed parameters table.

**Usage**

```
sumspict.priors(rep, ndigits = 8)
```

**Arguments**

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

**Value**

data.frame containing fixed parameter information.

---

sumspict.srefpoints	<i>Stochastic reference points of a fit.spict() run.</i>
---------------------	--

---

**Description**

Stochastic reference points of a fit.spict() run.

**Usage**

```
sumspict.srefpoints(rep, ndigits = 8)
```

**Arguments**

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

**Value**

data.frame containing stochastic reference points.

---

sumspict.states	<i>State estimates of a fit.spict() run.</i>
-----------------	--

---

**Description**

State estimates of a fit.spict() run.

**Usage**

```
sumspict.states(rep, ndigits = 8)
```

**Arguments**

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

**Value**

data.frame containing state estimates.

---

take.c	<i>Calculate management when taking a constant catch (proxy for setting a TAC).</i>
--------	---

---

**Description**

Calculate management when taking a constant catch (proxy for setting a TAC).

**Usage**

```
take.c(catch, inpin, repin, dbg = 0, sdfac = 0.001, catchList = NULL)
```

**Arguments**

catch	Take this catch 'dtpredc' ahead from manstart time
inpin	Input list.
repin	Results list.
dbg	Debug flag, dbg=1 some output, dbg=2 more output.
sdfac	Take catch with this 'stdevfacC' (default = 1e-3)
catchList	list with numeric vectors timeC and obsC with the starting times and catches

**Value**

List containing results of management calculations.

---

test.spict	<i>Example of a spict analysis.</i>
------------	-------------------------------------

---

**Description**

Example of a spict analysis.

**Usage**

```
test.spict(dataset = "albacore")
```

**Arguments**

dataset	Specify one of the three test data sets: 'albacore', 'hake', 'lobster'. These can be accessed with the command data(pol).
---------	---

**Details**

Loads a data set, fits the model, calculates one-step-ahead residuals, plots the results.

**Value**

A result report as given by fit.spict().

**Examples**

```
## Not run:
rep <- test.spict()

## End(Not run)
```

---

trans2real	<i>Get real parameter values from transformed ones.</i>
------------	---

---

**Description**

Get real parameter values from transformed ones.

**Usage**

```
trans2real(vals, nms, chgnms = TRUE)
```

**Arguments**

vals	Parameters in transformed domain.
nms	Names of transformed parameters (including log etc.)
chgnms	Remove transformation indication from the parameter names (e.g. remove log from logK).

**Value**

Parameter values in the natural domain.

---

true.col	<i>Load color of true values from simulation.</i>
----------	---

---

**Description**

Load color of true values from simulation.

**Usage**

```
true.col()
```

**Value**

Color vector

---

txt.stamp	<i>Add a charater string in the bottom right corner of a plot</i>
-----------	---

---

**Description**

Add a charater string in the bottom right corner of a plot

**Usage**

```
txt.stamp(string = get.version(), cex = 0.5, do.flag = NULL)
```

**Arguments**

string	Character string to stamp. If it is an empty string, NULL, or NA the function does nothing
cex	Stamp cex.
do.flag	If NULL stamp will be added if not in a multi plot, i.e. <code>mean(par())\$mfrow) != 1</code>

**Value**

Nothing

---

validate.spict	<i>Simulate data and reestimate parameters</i>
----------------	--

---

## Description

Given input parameters simulate a number of data sets. Then estimate the parameters from the simulated data and compare with the true values. Specifically, the one-step-ahead residuals are checked for autocorrelation and the confidence intervals of the estimated Fmsy and Bmsy are checked for consistency.

## Usage

```
validate.spict(inp, nsim = 50, invec = c(15, 60, 240), estinp = NULL,
  backup = NULL, df.out = FALSE, summ.ex.file = NULL,
  type = "nobs", parnames = NULL, exp = NULL, mc.cores = 8,
  model = "spict")
```

## Arguments

inp	An inp list with an ini key (see ?check.inp). If you want to use estimated parameters for the simulation create the inp\$ini from the pl key of a result of fit.spict().
nsim	Number of simulated data sets in each batch.
invec	Vector containing the number of simulated observations of each data set in each batch.
estinp	The estimation uses the true parameters as starting guess. Other initial values to be used for estimation can be specified in estinp\$ini.
backup	Since this procedure can be slow a filename can be specified in backup where the most recent results will be available.
df.out	Output data frame instead of list.
summ.ex.file	Save a summary example to this file (to check that parameters have correct priors or are fixed).
type	Specify what type of information is contained in invec. If type == 'nobs' then invec is assumed to be a vector containing the number of simulated observations of each data set in each batch. If type == 'logsd' then invec is assumed to be a vector containing values of logsd over which to loop.
parnames	Vector of parameter names to extract stats for.
exp	Should exp be taken of parameters?
mc.cores	Number of cores to use.
model	If 'spict' estimate using SPiCT. If 'meyermillar' estimate using the model of Meyer & Millar (1999), this requires rjags and coda packages.

**Value**

A list containing the results of the validation with the following keys:

- "osarpvals" P-values of the Ljung-Box test for uncorrelated one-step-ahead residuals.
- "\*msyci" Logical. TRUE if the true value of B/Fmsy was inside the 95% confidence interval for the estimate, otherwise FALSE
- "\*msyciw" Width of the 95% confidence interval of the estimate of Bmsy/Fmsy.

**Note**

WARNING: One should simulate at least 50 data sets and preferably more than 100 to obtain reliable results. This will take some time (potentially hours).

**Examples**

```
## Not run:
data(pol)
rep0 <- fit.spict(pol$albacore)
inp <- list()
inp$ini <- rep0$pl
set.seed(1234)
validate.spict(inp, nsim=10, invec=c(30, 60), backup='validate.RData')

## End(Not run)
```

---

validation.data.frame *Collect results from the output of running validate.spict.*

---

**Description**

Collect results from the output of running validate.spict.

**Usage**

```
validation.data.frame(ss)
```

**Arguments**

ss                      Output from validation.spict.

**Value**

A data frame containing the formatted validation results.

---

<code>warning.stamp</code>	<i>Add warning sign to plot</i>
----------------------------	---------------------------------

---

**Description**

Add warning sign to plot

**Usage**

```
warning.stamp()
```

**Value**

Nothing

---

<code>write.aspic</code>	<i>Takes a SPiCT input list and writes it as an Aspic input file.</i>
--------------------------	---

---

**Description**

Takes a SPiCT input list and writes it as an Aspic input file.

**Usage**

```
write.aspic(input, filename = "spictout.a7inp", verbose = FALSE)
```

**Arguments**

<code>input</code>	List of input variables or the output of a simulation using <code>sim.spict()</code> .
<code>filename</code>	Name of the file to write.
<code>verbose</code>	If true write information to screen.

**Value**

Nothing.

**Examples**

```
data(pol)
sim <- (pol$albacore)
write.aspic(sim)
```

---

write.bug.file	<i>Write the BUGS code to a text file</i>
----------------	---

---

**Description**

The .bug file generated by this function contains code published in Meyer & Millar (1999).

**Usage**

```
write.bug.file(priors, fn = "tmp.bug")
```

**Arguments**

priors	List of priors, typically coming from <code>inp\$meyermillar\$priors</code> .
fn	Filename of to put BUGS code in.

**Value**

Nothing.
