

Package ‘spict’

September 23, 2019

Type Package

Title Stochastic surplus Production model in Continuous-Time (SPiCT)

Version 1.2.7

Date 2019-09-23

Author Martin Waever Pedersen

Maintainer Martin Waever Pedersen <mawp@dtu.dk>

Description Fits a surplus production model to fisheries catch and biomass index data.

License GPL (>=3)

Index	82
--------------	-----------

acf.signf	<i>Check whether ACF of residuals is significant in any lags.</i>
-----------	---

Description

Check whether ACF of residuals is significant in any lags.

Usage

```
acf.signf(resid, lag.max = 4, return.p = FALSE)
```

Arguments

resid	Vector of residuals.
lag.max	Only check from lag 1 until lag.max.
return.p	Return p-values of the calculated lags.

Details

This corresponds to plotting the ACF using `acf()` and checking whether any lags has an acf value above the CI limit.

Value

Vector of TRUE and FALSE indicating whether significant lags were present. If return.p is TRUE then p-values are returned instead.

add.catchunit	<i>Add catch unit to label</i>
---------------	--------------------------------

Description

Add catch unit to label

Usage

```
add.catchunit(lab, cu)
```

Arguments

lab	Base label
cu	Catch unit as a character string

Value

Label with added catch unit

add.col.legend	<i>Add a legend explaining colors of points (vertical orientation)</i>
----------------	--

Description

Add a legend explaining colors of points (vertical orientation)

Usage

```
add.col.legend()
```

Value

Nothing.

add.col.legend.hor	<i>Add a legend explaining colors of points (horizontal orientation)</i>
--------------------	--

Description

Add a legend explaining colors of points (horizontal orientation)

Usage

```
add.col.legend.hor()
```

Value

Nothing.

add.manlines	<i>Add lines to plot indicating result of management scenarios.</i>
--------------	---

Description

Add lines to plot indicating result of management scenarios.

Usage

```
add.manlines(rep, par, par2 = NULL, index.shift = 0,
  plot.legend = TRUE, ...)
```

Arguments

rep	A result report as generated by running fit.spict.
par	The name of the parameter to be plotted.
par2	If a second parameter should be used as explanatory variable instead of time.
index.shift	Shift initial time point by this index.

Value

Nothing

annual	<i>Convert from quarterly (or other sub-annual) data to annual means, sums or a custom function.</i>
--------	--

Description

Convert from quarterly (or other sub-annual) data to annual means, sums or a custom function.

Usage

```
annual(intime, vec, type = "mean")
```

Arguments

intime	A time vector corresponding to the values in vec.
vec	The vector of values to convert to annual means
type	If type='mean' then annual mean is calculated, if type='sum' then annual sum is calculated. If type is a function, that function is used.

Value

A list containing the annual means and a corresponding time vector.

arrow.line	<i>Draw a line with arrow heads.</i>
------------	--------------------------------------

Description

Draw a line with arrow heads.

Usage

```
arrow.line(x, y, length = 0.25, angle = 30, code = 2,
  col = par("fg"), lty = par("lty"), lwd = par("lwd"), ...)
```

Arguments

x	X coordinates.
y	Y coordinates.
length	See documentation for arrows.
angle	See documentation for arrows.
code	See documentation for arrows.
col	See documentation for arrows.
lty	See documentation for arrows.
lwd	See documentation for arrows.
...	See documentation for arrows.

Details

Add to an existing plot a continuous line with arrow heads showing the direction between each data point

Value

Nothing, but an arrow line is added to the current plot.

calc.bmsyk	<i>Calculates the Bmsy/K ratio</i>
------------	------------------------------------

Description

Calculates the Bmsy/K ratio

Usage

```
calc.bmsyk(rep)
```

Arguments

rep	Result of fit.spict().
-----	------------------------

Value

Bmsy/K

Author(s)

T.K. Mildenberger <t.k.mildenberger@gmail.com>

calc.EBinf	<i>Calculate E(Binfinity), i.e. the fished equilibrium.</i>
------------	---

Description

Calculate E(Binfinity), i.e. the fished equilibrium.

Usage

```
calc.EBinf(K, n, F1, Fmsy, sdb2)
```

Arguments

K	The carrying capacity.
n	Pella-Tomlinson exponent.
F1	Average fishing mortality of the last year.
Fmsy	Fishing mortality at MSY.
sdb2	Standard deviation squared (variance) of B process.

Details

If a seasonal pattern in F is imposed the annual average F is used for calculating the expectation. Max() is used to avoid negative values.

Value

E(Binf).

calc.gamma	<i>Calculate gamma from n</i>
------------	-------------------------------

Description

Calculate gamma from n

Usage

```
calc.gamma(n)
```

Arguments

n	Exponent of the Pella-Tomlinson surplus production equation.
---	--

calc.influence	<i>Calculates influence statistics of observations.</i>
----------------	---

Description

Calculates influence statistics of observations.

Usage

```
calc.influence(rep)
```

Arguments

rep	A valid result from fit.spict().
-----	----------------------------------

Details

TBA

Value

A list equal to the input with the added key "infl" containing influence statistics.

calc.om

*Calculates the order of magnitude for the relative reference levels
B/Bmsy and F/Fmsy*

Description

Calculates the order of magnitude for the relative reference levels B/Bmsy and F/Fmsy

Usage

```
calc.om(rep)
```

Arguments

rep Result of fit.spict().

Details

The lower, upper values and the CI range are based on the 95

Value

Matrix containing the order of magnitude for B/Bmsy and F/Fmsy.

Author(s)

T.K. Mildenberger <t.k.mildenberger@gmail.com>

calc.osa.resid	<i>Calculate one-step-ahead residuals.</i>
----------------	--

Description

Calculate one-step-ahead residuals.

Usage

```
calc.osa.resid(rep)
```

Arguments

rep	A result report as generated by running fit.spict.
-----	--

Details

In TMB one-step-ahead residuals are calculated by sequentially including one data point at a time while keeping the model parameters fixed at their ML estimates. The calculated residuals are tested for independence, bias, and normality.

Value

An updated result report, which contains one-step-ahead residuals stored in \$osarC and \$osarI.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.osar(rep)
```

change.euler	<i>Change the Euler time step in the input list</i>
--------------	---

Description

Change the Euler time step in the input list

Usage

```
change.euler(inp, dteuler = 1/16)
```

Arguments

inp	An input list containing data.
dteuler	Euler time step to update the input list with (default 1/16).

Details

The Euler time step (dteuler) affects the length of most time related vectors of the input list. This function allows the rescaling of all time related vectors of the input list based on the specified dteuler.

Value

Input list with updated dteuler.

Author(s)

T.K. Mildenberger <t.k.mildenberger@gmail.com>

check.euler

Check the sensitivity of estimated reference levels to the Euler time discretization

Description

Check the sensitivity of estimated reference levels to the Euler time discretization

Usage

```
check.euler(rep, dteuler = 1/64, nobs = 100, Frange = NULL)
```

Arguments

rep	Result of fit.spict().
dteuler	Euler time step to check against (default 1/64).
nobs	Number of years to simulate (default: 100)
Frange	Fishing mortality range to optimise over (2 values). If NULL (default) the range goes from 0.01 to 6.

Details

The difference between the reference levels is calculated by estimating the relative difference $((\text{curr} - \text{alt}) / \text{alt})$.

Value

Matrix with reference levels with current dteuler ('curr'), specified dteuler based on iterative estimation ('alt'), and the relative difference between them ('diff').

Author(s)

T.K. Mildenberger <t.k.mildenberger@gmail.com>

check.ini	<i>Check sensitivity of fit to initial parameter values</i>
-----------	---

Description

Check sensitivity of fit to initial parameter values

Usage

```
check.ini(input, ntrials = 10, verbose = TRUE, numdigits = 2)
```

Arguments

input	Either an inp list passing check.inp(), or a rep list where rep is the output of running fit.spict().
ntrials	The number of trials with different starting values to run.
verbose	If true write information to screen.
numdigits	Number of digits in reported results.

Value

List containing results of sensitivity check and associated initial values.

check.inp	<i>Check list of input variables</i>
-----------	--------------------------------------

Description

Check list of input variables

Usage

```
check.inp(inp)
```

Arguments

inp	List of input variables, see details for required variables.
-----	--

Details

Fills in default values if missing.

Required inputs:

- "inp\$obsC" Vector of catch observations.
- "inp\$obsI and/or inp\$obsE" List containing vectors of index observations and/or a vector of effort information.

Optional inputs:

- Data

- "inp\$timeC" Vector of catch times. Default: even time steps starting at 1.
- "inp\$timeI" List containing vectors of index times. Default: even time steps starting at 1.
- "inp\$timeE" Vector of effort times. Default: even time steps starting at 1.
- "inp\$dtc" Time interval for catches, e.g. for annual catches $\text{inp\$dtc}=1$, for quarterly catches $\text{inp\$dtc}=0.25$. Can be given as a scalar, which is then used for all catch observations. Can also be given as a vector specifying the catch interval of each catch observation. Default: $\min(\text{diff}(\text{inp\$timeC}))$.
- "inp\$dte" Time interval for effort observations. For annual effort $\text{inp\$dte}=1$, for quarterly effort $\text{inp\$dte}=0.25$. Default: $\min(\text{diff}(\text{inp\$timeE}))$.
- "inp\$nseasons" Number of within-year seasons in data. If $\text{inp\$nseasons} > 1$ then a seasonal pattern is used in F. Valid values of $\text{inp\$nseasons}$ are 1, 2 or 4. Default: number of unique within-year time points present in data.

- Initial parameter values

- "inp\$ini\$logn" Pella-Tomlinson exponent determining shape of production function. Default: $\log(2)$ corresponding to the Schaefer formulation.
- "inp\$ini\$logm" Initial value for logm (log maximum sustainable yield). Default: $\log(\text{mean}(\text{catch}))$.
- "inp\$ini\$logK" Initial value for logK (log carrying capacity). Default: $\log(4 \cdot \max(\text{catch}))$.
- "inp\$ini\$logq" Initial value for logq (log catchability of index). Default: $\log(\max(\text{index})/K)$.
- "inp\$ini\$logsdb" Initial value for logsdb (log standard deviation of biomass process). Default: $\log(0.2)$.
- "inp\$ini\$logsdf" Initial value for logsdf (log standard deviation of fishing mortality process). Default: $\log(0.2)$.
- "inp\$ini\$logsdi" Initial value for logsdi (log standard deviation of index observation error). Default: $\log(0.2)$.
- "inp\$ini\$logsdci" Initial value for logsdci (log standard deviation of catch observation error). Default: $\log(0.2)$.
- "inp\$ini\$phi" Vector for cyclic B spline representing within-year seasonal variation. Default: $\text{rep}(1, \text{inp\$nseasons})$.
- "inp\$ini\$logsdu" Initial value for logsdu (log standard deviation of log U, the state of the coupled SDE representation of seasonality). Default: $\log(0.1)$.

- "inp\$ini\$loglambda" Initial value for loglambda (log damping parameter of the coupled SDE representation of seasonality). Default: log(0.1).

- Initial values for unobserved states estimated as random effects

- "inp\$ini\$logF" Log fishing mortality. Default: log(0.2*r), with r derived from m and K.
- "inp\$ini\$logB" Log biomass. Default: log(0.5*K).
- "inp\$ini\$logU" Log U, the state of the coupled SDE representation of seasonality. Default: log(1).

- Priors

Priors on model parameters are assumed generally assumed Gaussian and specified in a vector of length 2: c(log(mean), stdev in log domain, useflag [optional]). NOTE: if specifying a prior for a value in a temporal vector e.g. logB, then a fourth element is required specifying the year the prior should be applied. log(mean): log of the mean of the prior distribution. stdev in log: standard deviation of the prior distribution in log domain. useflag: if 1 then the prior is used, if 0 it is not used. Default is 1. To list parameters to which priors can be applied run list.possible.priors(). Example: intrinsic growth rate of 0.8 `inp$priors$logr <- c(log(0.8), 0.1)` `inp$priors$logr <- c(log(0.8), 0.1, 1)` # This includes the optional useflag Example: Biomass prior of 200 in 1985 `inp$priors$logB <- c(log(200), 0.2, 1985)` `inp$priors$logB <- c(log(200), 0.2, 1, 1985)` # This includes the optional useflag Example: Inverse gamma prior on sdb^2: `inp$priors$isdb2gamma <- meanvar2shaperate(1/exp(inpinilogsdB)^2, 150^2)`

- Settings/Options/Preferences

- "inp\$dtpredc" Length of catch prediction interval in years. Default: max(inp\$dtc). Should be 1 to get annual predictions and 0.25 for quarterly predictions.
- "inp\$timepredc" Predict accumulated catch in the interval starting at \$timepredc and \$dtpredc into the future. Default: Time of last observation. Example: `inp$timepredc <- 2012`
- "inp\$timepredi" Predict index until this time. Default: Time of last observation. Example: `inp$timepredi <- 2012`
- "inp\$do.sd.report" Flag indicating whether SD report (uncertainty of derived quantities) should be calculated. For small values of inp\$dteuler this may require a lot of memory. Default: TRUE.
- "inp\$reportall" Flag indicating whether quantities derived from state vectors (e.g. B/Bmsy, F/Fmsy etc.) should be calculated by SD report. For small values of inp\$dteuler (< 1/32) reporting all may have to be set to FALSE for sdreport to run. Additionally, if only reference points of parameter estimates are of interest one can set to FALSE to gain a speed-up. Default: TRUE.
- "inp\$robflagc" Flag indicating whether robust estimation should be used for catches (either 0 or 1). Default: 0.
- "inp\$robflagi" Vector of flags indicating whether robust estimation should be used for indices (either 0 or 1). Default: 0.
- "inp\$ffac" Management scenario represented by a factor to multiply F with when calculating the F of the next time step. ffac=0.8 means a 20% reduction in F over the next year. The factor is only used when predicting beyond the data set. Default: 1 (0% reduction).
- "inp\$dteuler" Length of Euler time step in years. Default: 1/16 year.

- "inp\$phases" Phases can be used to fix/free parameters and estimate in different stages or phases. To fix e.g. log r at inp\$ini\$log r set inp\$phases\$log r <- -1. To free log α and estimate in phase 1 set inp\$phases\$log α <- 1.
- "inp\$osar.method" Method to use in TMB's oneStepPredict function. Valid methods include: "oneStepGaussianOffMode", "fullGaussian", "oneStepGeneric", "oneStepGaussian", "cdf". See TMB help for more information. Default: "none" (i.e. don't run this).
- "inp\$osar.trace" If TRUE print OSAR calculation progress to screen. Default: FALSE.
- "inp\$osar.parallel" If TRUE parallelise OSAR calculation for speed-up. Default: FALSE.
- "inp\$catchunit" Specify unit of catches to be used in plotting legends. Default: "".
- "inp\$stddevfacC" Factors to multiply the observation error standard deviation of each individual catch observation. Can be used if some observations are more uncertain than others. Must be same length as observation vector. Default: 1.
- "inp\$stddevfacI" Factors to multiply the observation error standard deviation of each individual index observation. Can be used if some observations are more uncertain than others. A list with vectors of same length as observation vectors. Default: 1.
- "inp\$stddevfacE" Factors to multiply the observation error standard deviation of each individual effort observation. Can be used if some observations are more uncertain than others. A list with vectors of same length as observation vectors. Default: 1.
- "inp\$mapsdi" Vector of length equal to the number of index series specifying which indices that should use the same sdi. For example: in case of 3 index series use inp\$mapsdi <- c(1, 1, 2) to have series 1 and 2 share sdi and have a separate sdi for series 3. Default: 1:nindex, where nindex is number of index series.
- "inp\$seasontype" If set to 1 use the spline-based representation of seasonality. If set to 2 use the oscillatory SDE system (this is more unstable and difficult to fit, but also more flexible).

Value

An updated list of input variables checked for consistency and with defaults added.

Examples

```
data(pol)
(inp <- check.inp(pol$albacore))
```

extract.simstats

Extracts relevant statistics from the estimation of a simulated data set.

Description

Extracts relevant statistics from the estimation of a simulated data set.

Usage

```
extract.simstats(rep, inp = NULL, exp = NULL, parnames = NULL)
```

Arguments

rep	A result report as generated by running fit.spict.
inp	The input list used as input to the validation.spict function.
exp	Should exp be taken of parameters?
parnames	Vector of parameter names to extract stats for.

Details

TBA

Value

A list containing the relevant statistics.

Examples

```
data(pol)
repin <- fit.spict(pol$albacore)
sim <- sim.spict(repin)
rep <- fit.spict(sim)
extract.simstats(rep)
```

fd	<i>Format date</i>
----	--------------------

Description

Format date

Usage

```
fd(d, dec = 2)
```

Arguments

d	Point in time in years as decimal number.
dec	Number of decimals.

Value

Correctly formatted date.

fit.aspic	<i>Fits aspic to the data contained in the input file</i>
-----------	---

Description

Fits aspic to the data contained in the input file

Usage

```
fit.aspic(input, do.boot = FALSE, nboot = NULL, ciperc = NULL,
  verbose = FALSE, filebase = "tmp", savefile = NULL)
```

Arguments

input	A spict input list containing observations.
do.boot	Do bootstrap to get uncertainties of estimates?
nboot	Number of bootstrap runs (only used if do.boot=TRUE). Prager suggests in the ASPIC manual p. 13 to use nboot > 1000 if ciperc > 80.
ciperc	Coverage percentage (integer between 0 and 100) of bootstrapped confidence intervals.
verbose	If TRUE write information to screen.
filebase	Basename of all generated aspic files.
savefile	Save results to this file.

Details

Only works on Linux. This furthermore requires that wine is installed and that aspic7 is installed and available to the PATH.

Value

List containing aspic results.

fit.jags	<i>Fit the Meyer & Millar model using rjags</i>
----------	---

Description

Fit the Meyer & Millar model using rjags

Usage

```
fit.jags(inp, fn, n.iter = 10000, n.chains = 1,
  burnin = round(n.iter/2), thin = 1000)
```

Arguments

inp	Input list containing data and settings.
fn	Filename of containing BUGS code.
n.iter	Number of iterations.
n.chains	Number of chains.
burnin	Number of burn-in iterations.
thin	Thin chains by this value.

Value

The raw output of `rjags::coda.samples`.

fit.meyermillar	<i>Fit the model of Meyer & Millar (1999)</i>
-----------------	---

Description

Fit the model of Meyer & Millar (1999)

Usage

```
fit.meyermillar(mminp)
```

Arguments

mminp	Input list similar to the input to <code>fit.spict()</code>
-------	---

Details

Same input structure as for `fit.spict()`. Fitting the model of Meyer & Millar requires the packages `rjags` and `coda`. It furthermore requires that priors are specified for `K`, `r`, `q`, `sigma2` (process error variance) and `tau2` (observation error variance). Following Meyer & Millar (1999) the priors are:

- "K" log-normal.
- "r" log-normal.
- "q" inverse-gamma.
- "tau2" inverse-gamma.
- "sigma2" inverse-gamma.

See example for how to specify priors.

Value

List containing results

Examples

```
priors <- list()
priors$K <- c(5.042905, 3.76)
priors$r <- c(-1.38, 3.845)
priors$iq <- c(0.001, 0.0012)
priors$itau2 <- c(1.709, 0.00861342)
priors$isigma2 <- c(3.785518, 0.0102232)
priors$logPini <- -0.223
data(pol)
inp <- pol$albacore
inp$meyermillar$n.iter <- 10000
inp$meyermillar$burnin <- 1000
inp$meyermillar$thin <- 10
inp$meyermillar$n.chains <- 1
inp$meyermillar$priors <- priors
res <- fit.meyermillar(inp)
summary(res$jags)
```

fit.spict

Fit a continuous-time surplus production model to data.

Description

Fit a continuous-time surplus production model to data.

Usage

```
fit.spict(inp, dbg = 0)
```

Arguments

inp	List of input variables as output by check.inp.
dbg	Debugging option. Will print out runtime information useful for debugging if set to 1. Will print even more if set to 2.

Details

Fits the model using the TMB package and returns a result report containing estimates of model parameters, random effects (biomass and fishing mortality), reference points (Fmsy, Bmsy, MSY) including uncertainties given as standard deviations.

Model parameters using the formulation of Fletcher (1978):

- "logn" Parameter determining the shape of the production curve as in the generalised form of Pella & Tomlinson (1969).
- "logm" Log of maximum sustainable yield.
- "logK" Log of carrying capacity.
- "logq" Log of catchability vector.

- "logsdb" Log of standard deviation of biomass process error.
- "logsdf" Log of standard deviation of fishing mortality process error.
- "logsdi" Log of standard deviation of index observation error.
- "logsdc" Log of standard deviation of catch observation error.

Unobserved states estimated as random effects:

- "logB" Log of the biomass process given by the stochastic differential equation: $dB_t = r \cdot B_t \cdot (1 - (B_t/K)^n) \cdot dt + sdb \cdot dW_t$, where dW_t is Brownian motion.
- "logF" Log of the fishing mortality process given by: $dlog(F_t) = f(t, sdf)$, where the function f depends on the choice of seasonal model.

Other parameters (which are only needed in certain cases):

- "logphi" Log of parameters used to specify the cyclic B spline representing seasonal variation. Used when `inp$nseasons > 1` and `inp$seasontype = 1`.
- "logU" Log of the state of the coupled SDE system used to represent seasonal variation, i.e. when `inp$nseasons > 1` and `inp$seasontype = 2`.
- "loglambda" Log of damping parameter when using the coupled SDE system to represent seasonal variation, i.e. when `inp$nseasons > 1` and `inp$seasontype = 2`.
- "logsdu" Log of standard deviation of process error of U_t (the state of the coupled SDE system) used to represent seasonal variation, i.e. when `inp$nseasons > 1` and `inp$seasontype = 2`.
- "logsde" Log of standard deviation of observation error of effort data. Only used if effort data is part of input.
- "logp1robfac" Log plus one of the coefficient to the standard deviation of the observation error when using a mixture distribution robust toward outliers, i.e. when either `inp$robflag = 1` and/or `inp$robflagi = 1`.
- "logitpp" Logit of the proportion of narrow distribution when using a mixture distribution robust toward outliers, i.e. when either `inp$robflag = 1` and/or `inp$robflagi = 1`.

Parameters that can be derived from model parameters:

- "logr" Log of intrinsic growth rate ($r = 4m/K$).
- "logalpha" Proportionality factor for the observation noise of the indices and the biomass process noise: $sdi = \exp(\logalpha) \cdot sdb$. (normally set to `logalpha=0`)
- "logbeta" Proportionality factor for the observation noise of the catches and the fishing mortality process noise: $sdc = \exp(\logbeta) \cdot sdf$. (this is often difficult to estimate and can result in divergence of the optimisation. Normally set to `logbeta=0`)
- "logBmsy" Log of the equilibrium biomass (B_{msy}) when fished at F_{msy} .
- "logFmsy" Log of the fishing mortality (F_{msy}) leading to the maximum sustainable yield.
- "MSY" The yield when the biomass is at B_{msy} and the fishing mortality is at F_{msy} , i.e. the maximum sustainable yield.

The above parameter values can be extracted from the `fit.spict()` results using `get.par()`.

Model assumptions

- "1" The intrinsic growth rate (r) represents a combination of natural mortality, growth, and recruitment.
- "2" The biomass B_t refers to the exploitable part of the stock. Estimates in absolute numbers (K , B_{msy} , etc.) should be interpreted in light of this.
- "3" The stock is closed to migration.
- "4" Age and size-distribution are stable in time.
- "5" Constant catchability of the gear used to gather information for the biomass index.

Value

A result report containing estimates of model parameters, random effects (biomass and fishing mortality), reference points (F_{msy} , B_{msy} , MSY) including uncertainties given as standard deviations.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
Bmsy <- get.par('logBmsy', rep, exp=TRUE)
summary(rep)
plot(rep)
```

get.AIC

Calculate AIC from a rep list.

Description

Calculate AIC from a rep list.

Usage

```
get.AIC(rep)
```

Arguments

rep A result report as generated by running fit.spict.

Value

AIC

get.catchindexoverlap *Find observations of catch and index that overlap*

Description

Find observations of catch and index that overlap

Usage

```
get.catchindexoverlap(inp)
```

Arguments

inp An input list containing data.

Value

List containing overlapping catch (y) and index (z) observations and their time vectors.

get.colnms *Get column names for data.frames.*

Description

Get column names for data.frames.

Usage

```
get.colnms()
```

Value

Vector containing column names of data frames.

get.cov	<i>Get covariance matrix of two reported quantities not of fixed model parameters. Covariance of fixed model parameters can be found in rep\$cov.fixed.</i>
---------	---

Description

Get covariance matrix of two reported quantities not of fixed model parameters. Covariance of fixed model parameters can be found in rep\$cov.fixed.

Usage

```
get.cov(rep, parname1, parname2, cor = FALSE)
```

Arguments

rep	Result of fit.spict().
parname1	Name first parameter.
parname2	Name second parameter.
cor	If TRUE correlation matrix is reported instead of covariance matrix

Value

Covariance matrix of specified parameters.

get.EBinf	<i>Calculate E(Binfinity) the fished equilibrium.</i>
-----------	---

Description

Calculate E(Binfinity) the fished equilibrium.

Usage

```
get.EBinf(rep)
```

Arguments

rep	A result of fit.spict.
-----	------------------------

Details

If a seasonal pattern in F is imposed the annual average F is used for calculating the expectation.

Value

E(Binf).

get.mfrow

Get mfrow from the number of plots to be plotted

Description

Get mfrow from the number of plots to be plotted

Usage

```
get.mfrow(n)
```

Arguments

n Number of plots to be plotted.

Value

Nothing

get.msyvec

If multiple growth rates (r) are used (e.g. for a seasonal model), return specified reference point for all instances of r.

Description

If multiple growth rates (r) are used (e.g. for a seasonal model), return specified reference point for all instances of r.

Usage

```
get.msyvec(inp, msy)
```

Arguments

inp An input list as validated by check.inp().
 msy Matrix containing reference point values as given by get.par().

Value

A list containing reference point estimates with upper and lower CI bounds.

get.order	<i>Get order of printed quantities.</i>
-----------	---

Description

Get order of printed quantities.

Usage

```
get.order()
```

Value

Vector containing indices of printed quantities.

get.osar.pvals	<i>Check whether ACF of catch and index residuals is significant in any lags.</i>
----------------	---

Description

Check whether ACF of catch and index residuals is significant in any lags.

Usage

```
get.osar.pvals(rep)
```

Arguments

rep	Result of fit.spict(), but requires that also residuals have been calculated using calc.osa.resic().
-----	--

Value

Vector of p-values of length equal to the number of data series.

get.par	<i>Extract parameters from a result report as generated by fit.spict.</i>
---------	---

Description

Extract parameters from a result report as generated by fit.spict.

Usage

```
get.par(parname, rep = rep, exp = FALSE, random = FALSE,
        fixed = FALSE)

list.quantities(rep)
```

Arguments

parname	Character string containing the name of the variable of interest.
rep	A result report as generated by running fit.spict.
exp	Take exp of the variable? TRUE/FALSE.
random	DUMMY not used anymore. (Is the variable a random effect? TRUE/FALSE.)
fixed	DUMMY not used anymore. (Is the variable a fixed effect? TRUE/FALSE.)

Details

get.par is a helper function for extracting the value and uncertainty of a specific model parameter, random effect or derived quantity. list.quantities gives the names of all quantities.

Value

get.par returns a matrix with four columns containing respectively: 1) the lower 95

Examples

```
## Make the south Atlantic albacore assessment
data(pol)
rep <- fit.spict(pol$albacore)

## See all quantities that can be extracted
list.quantities(rep)

## Extract the Bmsy reference point
Bmsy <- get.par('logBmsy', rep, exp=TRUE)

## Extract the exploitable biomass estimates
Best <- get.par('logB', rep, exp=TRUE)

## Extract the estimated carrying capacity
K <- get.par('logK', rep, exp=TRUE)
```

get.prod.regimes	<i>Calculate AIC for spict models with different productivity regime shifts</i>
------------------	---

Description

Calculate AIC for spict models with different productivity regime shifts

Usage

```
get.prod.regimes(inp, years = NULL)
```

Arguments

inp	An input list containing data.
years	Optional; vector with years for the estimation of the regime shift. By default (NULL) all years of the input data are used.

Value

data frame with years and AIC

get.spline	<i>Get the values of the seasonal spline for F.</i>
------------	---

Description

Get the values of the seasonal spline for F.

Usage

```
get.spline(logphi, order, dtfine = 1/100)
```

Arguments

logphi	Values of the phi vector.
order	Order of the spline.
dtfine	Time between points where spline is evaluated.

Value

Spline values at the points between 0 and 1 with dtfine as time step.

get.version	<i>Get version of spict including git sha1 version if available.</i>
-------------	--

Description

Get version of spict including git sha1 version if available.

Usage

```
get.version(pkg = "spict")
```

Arguments

pkg	Name of package.
-----	------------------

Value

Package version

guess.m	<i>Use a simple linear regression to guess m (MSY).</i>
---------	---

Description

Use a simple linear regression to guess m (MSY).

Usage

```
guess.m(inp, all.return = FALSE)
```

Arguments

inp	An input list containing data.
all.return	If true also return a guess on Emsy (effort at MSY) and components of the linear regression.

Details

Equations 9.1.7 and 9.1.8 on page 284 of FAO's tropical assessment book are used to guess MSY.

Value

The guess on MSY.

invlogit	<i>Inverse logit transform.</i>
----------	---------------------------------

Description

Inverse logit transform.

Usage

invlogit(a)

Arguments

a Value to take inverse logit of.

Value

Inverse logit.

invlogp1	<i>Inverse log "plus one" transform</i>
----------	---

Description

Inverse log "plus one" transform

Usage

invlogp1(a)

Arguments

a Value to take inverse logp1 of.

Details

If $a = \log(b-1)$, then the inverse transform is $b = 1 + \exp(a)$. Useful for values with lower bound at 1.

Value

Inverse logp1.

latex.figure	<i>Generate latex code for including a figure.</i>
--------------	--

Description

Generate latex code for including a figure.

Usage

```
latex.figure(figfile, reportfile, caption = "")
```

Arguments

figfile	Path to figure file.
reportfile	Path to report file.
caption	This character string will be included as the figure caption.

Value

Nothing.

likprof.spict	<i>Create profile likelihood</i>
---------------	----------------------------------

Description

Create profile likelihood

Usage

```
likprof.spict(input, verbose = FALSE)
```

Arguments

input	A list containing observations and initial values for non profiled parameters (essentially an inp list) with the additional key "likprof" (see details for required keys). A valid result from fit.spict() containing an "inp" key with the described properties is also accepted.
verbose	Print progress to screen.

Details

The "likprof" list must contain the following keys:

- "pars" A character vector of length equal 1 or 2 containing the name(s) of the parameters to calculate the profile likelihood for.
- "parrange" A vector containing the parameter range(s) to profile over: `parrange = c(min(par1), max(par1), min(par2), max(par2))`.

Optional:

- "nogridpoints" Number of grid points to evaluate the profile likelihood for each parameter. Default: 9. Note: with two parameters the calculation time increases quadratically when increasing the number of gridpoints.

Value

The output is the input with the likelihood profile information added to the `likprof` key of either `inp` or `rep$inp`.

Examples

```
data(pol)
inp <- pol$albacore
inp$likprof <- list()
inp$likprof$pars <- 'logK'
inp$likprof$parrange <- c(log(80), log(400))
inp$likprof$nogridpoints <- 15
rep <- fit.spict(inp)
rep <- likprof.spict(rep)
plotspict.likprof(rep, logpar=TRUE)
```

`list.possible.priors` *List parameters to which priors can be added*

Description

List parameters to which priors can be added

Usage

```
list.possible.priors()
```

Value

Prints parameters to which priors can be added.

make.datin	Create data list used as input to TMB::MakeADFun.
------------	---

Description

Create data list used as input to TMB::MakeADFun.

Usage

```
make.datin(inp, dbg = 0)
```

Arguments

inp	List of input variables as output by check.inp.
dbg	Debugging option. Will print out runtime information useful for debugging if set to 1.

Value

List to be used as data input to TMB::MakeADFun.

make.ellipse	Calculate confidence ellipsis.
--------------	--------------------------------

Description

Calculate confidence ellipsis.

Usage

```
make.ellipse(inds, rep)
```

Arguments

inds	Indices of the two reported model parameters.
rep	A result report as generated by running fit.spict.

Details

Calculates the confidence ellipsis of two reported model parameters. This is particularly useful as a detailed view of the uncertainty of two correlated parameters.

Value

A matrix with two columns containing the x and y coordinates of the ellipsis.

make.ffacvec	<i>Make ffac vector</i>
--------------	-------------------------

Description

Make ffac vector

Usage

```
make.ffacvec(inp, ffac)
```

Arguments

inp	Input list
ffac	Factor to multiply current F by

Value

Input list containing ffacvec

make.obj	<i>Create TMB obj using TMB::MakeADFun and squelch screen printing.</i>
----------	---

Description

Create TMB obj using TMB::MakeADFun and squelch screen printing.

Usage

```
make.obj(datin, pl, inp, phase = 1)
```

Arguments

datin	Data list.
pl	Parameter list.
inp	List of input variables as output by check.inp.
phase	Estimation phase, integer.

Value

List to be used as data input to TMB.

make.report	<i>Creates a pdf file containing the summary output and result plots</i>
-------------	--

Description

Creates a pdf file containing the summary output and result plots

Usage

```
make.report(rep, reporttitle = "", reportfile = "report.tex",
  summaryoutfile = "summaryout.txt", keep.figurefiles = FALSE,
  keep.txtfiles = FALSE, keep.texfiles = FALSE)
```

Arguments

rep	A valid result from fit.spict with OSA residuals.
reporttitle	This character string will be printed as the first line of the report.
reportfile	A connection , or a character string naming the file ('.tex' file) to print to. If not a connection, make.report prints to the working directory (default).
keep.figurefiles	If TRUE generated figure files will not be cleaned up.
keep.txtfiles	If TRUE generated txt files will not be cleaned up.
keep.texfiles	If TRUE generated tex file will not be cleaned up.

Details

This function probably requires that you are running linux and that you have latex functions installed (pdflatex).

Value

Nothing.

make.rpellipse	<i>Calculate confidence ellipsis for reference points.</i>
----------------	--

Description

Calculate confidence ellipsis for reference points.

Usage

```
make.rpellipse(rep)
```

Arguments

rep A result report as generated by running fit.spict.

Details

Calculates the confidence ellipsis of logBmsy and logFmsy (last if multiple)

Value

A matrix with two columns containing the x and y coordinates of the ellipsis.

make.splinemat	<i>Make a spline design matrix</i>
----------------	------------------------------------

Description

Make a spline design matrix

Usage

```
make.splinemat(nseasons, order, dtfine = 1/100)
```

Arguments

nseasons Number of seasons
order Order of the spline
dtfine Time between points where spline is evaluated

Value

Spline design matrix.

man.cols	<i>Load color of management scenarios.</i>
----------	--

Description

Load color of management scenarios.

Usage

```
man.cols()
```

Value

Color vector

manage	<i>Calculate predictions under different management scenarios</i>
--------	---

Description

Calculate predictions under different management scenarios

Usage

```
manage(repin, scenarios = "all", manstart = NULL, dbg = 0,
       catch = NULL, catchList = NULL)
```

Arguments

repin	Result list from fit.spict().
scenarios	Vector of integers specifying which scenarios to run. Default: 'all'.
manstart	Year that management should be initiated.
dbg	Debug flag, dbg=1 some output, dbg=2 more output.

Details

Scenarios that are currently implemented include:

- "1" Keep the catch of the current year (i.e. the last observed catch).
- "2" Keep the F of the current year.
- "3" Fish at Fmsy i.e. $F=F_{msy}$.
- "4" No fishing, reduce to 1% of current F.
- "5" Reduce F by X%. Default X = 25.
- "6" Increase F by X%. Default X = 25.
- "7" Use ICES MSY advice rule.

Scenario 7 implements the ICES MSY advice rule for stocks that are assessed using spict (ICES 2017). MSY B_trigger is set equal to $B_{MSY} / 2$. Then fishing mortality in the short forecast is calculated as:

$$F(y+1) = F(y) * \min(1, \text{median}[B(y+1) / \text{MSY B_trigger}] / \text{median}[F(y)/F_{MSY}])$$

Value

List containing results of management calculations.

References

ICES. 2017. Report of the Workshop on the Development of the ICES approach to providing MSY advice for category 3 and 4 stocks (WKMSYCat34), 6-10 March 2017, Copenhagen, Denmark. ICES CM 2017/ ACOM:47. 53 pp.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
repman <- manage(rep)
mansummary(repman) # To print projections
```

<code>mansummary</code>	<i>Print management summary.</i>
-------------------------	----------------------------------

Description

Print management summary.

Usage

```
mansummary(repin, ypred = 1, include.EBinf = FALSE,
  include.unc = TRUE, verbose = TRUE)
```

Arguments

<code>repin</code>	Result list as output from <code>manage()</code> .
<code>ypred</code>	Show results for <code>ypred</code> years from <code>manstart</code> .
<code>include.EBinf</code>	Include EBinf/Bmsy in the output.
<code>include.unc</code>	Include uncertainty of management quantities.
<code>verbose</code>	Print more details on observed and predicted time intervals.

Value

Data frame containing management summary.

<code>meanvar2shaperate</code>	<i>Convert mean and variance to shape and rate of gamma distribution</i>
--------------------------------	--

Description

Convert mean and variance to shape and rate of gamma distribution

Usage

```
meanvar2shaperate(mean, var)
```

Arguments

<code>mean</code>	Mean value.
<code>var</code>	Variance.

Value

Vector containing shape and rate parameters.

plot.col	<i>Plot model points colored depending on the quarter to which they belong.</i>
----------	---

Description

Plot model points colored depending on the quarter to which they belong.

Usage

```
## S3 method for class 'col'
plot(time, obs, obsx = NULL, pch = 1, add = FALSE,
      typ = "p", do.line = TRUE, add.legend = FALSE,
      add.vline.at = NULL, ...)
```

Arguments

time	Time vector.
obs	Observation vector (or residual vector).
obsx	Second observation vector for use as independent variable instead of time.
pch	Point character.
add	If TRUE plot is added to the current plot.
typ	Plot type.
do.line	If TRUE draw a line between points.
add.legend	If TRUE add legend containing information on quarters.
add.vline.at	If not NULL will draw a vertical line at the given time point.
...	Additional plotting arguments.

Value

Nothing.

plot.spictcls	<i>Plot summarising spict results.</i>
---------------	--

Description

Plot summarising spict results.

Usage

```
## S3 method for class 'spictcls'
plot(x, stamp = get.version(), ...)
```

Arguments

x	A result report as generated by running fit.spict.
...	additional arguments affecting the summary produced.

Details

Create a plot containing the following:

- 1. Estimated biomass using plotspict.biomass().
- 2. Estimated fishing mortality using plotspict.f().
- 3. Observed versus predicted catches using plotspict.catch().
- 4. Estimated biomass relative to Bmsy using plotspict.bbmsy().
- 5. Estimated fishing mortality relative to Fmsy using plotspict.ffmsy().
- 6. Estimated F versus estimated B using plotspict.fb().
- 7. Observed versus theoretical production using plotspict.production().

Optional plots included if relevant:

- Estimated seasonal spline using plotspict.season().
- Calculated time-constant using plotspict.tc().
- First prior and corresponding posterior distribution using plotspict.priors().
- One-step-ahead residuals of catches using plotspict.osar().
- One-step-ahead residuals of catches using plotspict.osar().

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plot(rep)
```

plotmm.priors	<i>Plot priors of Meyer & Millar model</i>
---------------	--

Description

Plot priors of Meyer & Millar model

Usage

```
## S3 method for class 'priors'
plot(nm, priorsin, add = TRUE, ...)
```

Arguments

nm	Name of prior
priorsin	List of priors, typically in <code>inp\$meymillar\$priors</code> .
add	If TRUE add to current plot.
...	Additional arguments to plot.

Value

Nothing.

plotspict.bbmsy	<i>Plot estimated B/Bmsy.</i>
-----------------	-------------------------------

Description

Plot estimated B/Bmsy.

Usage

```
plotspict.bbmsy(rep, logax = FALSE, main = "Relative biomass",
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE, lineat = 1,
  xlab = "Time", stamp = get.version())
```

Arguments

rep	A result report as generated by running <code>fit.spict</code> .
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
plot.obs	If TRUE observations are plotted.

qlegend	If TRUE legend explaining colours of observation data is plotted.
lineat	Draw horizontal line at this y-value.
xlab	Label of x-axis.
stamp	Stamp plot with this character string.

Details

Plots estimated B/Bmsy.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.bbmsy(rep)
```

plotspict.biomass	<i>Plot estimated biomass.</i>
-------------------	--------------------------------

Description

Plot estimated biomass.

Usage

```
plotspict.biomass(rep, logax = FALSE, main = "Absolute biomass",
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE, xlab = "Time",
  ylab = NULL, rel.axes = TRUE, rel.ci = TRUE,
  stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
plot.obs	If TRUE observations are plotted.
qlegend	If TRUE legend explaining colours of observation data is plotted.
xlab	Label of x-axis.
ylab	Label of y-axis.
rel.axes	Plot secondary y-axis containing relative level of F.
rel.ci	Plot confidence interval for relative level of F.
stamp	Stamp plot with this character string.

Details

Plots estimated biomass, Bmsy with confidence limits.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.biomass(rep)
```

plotspict.btrend	<i>Plot the expected biomass trend</i>
------------------	--

Description

Plot the expected biomass trend

Usage

```
plotspict.btrend(rep)
```

Arguments

rep A result report as generated by running fit.spict.

Value

Nothing.

plotspict.catch	<i>Plot observed catch and predictions.</i>
-----------------	---

Description

Plot observed catch and predictions.

Usage

```
plotspict.catch(rep, main = "Catch", ylim = NULL, qlegend = TRUE,
  lcol = "blue", xlab = "Time", ylab = NULL, stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
main	Title of plot.
ylim	Limits for y-axis.
qlegend	If TRUE legend explaining colours of observation data is plotted.
lcol	Colour of prediction lines.
xlab	Label of x-axis.
ylab	Label of y-axis.
stamp	Stamp plot with this character string.

Details

Plots observed catch and predictions using the current F and F_{msy} . The plot also contains the equilibrium catch if the current F is maintained.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.catch(rep)
```

plotspict.ci	<i>Plot catch and index data.</i>
--------------	-----------------------------------

Description

Plot catch and index data.

Usage

```
plotspict.ci(inp, stamp = get.version())
```

Arguments

inp	An input list containing data.
stamp	Stamp plot with this character string.

Value

Nothing

plotspict.data	<i>Plot input data</i>
----------------	------------------------

Description

Plot input data

Usage

```
plotspict.data(inpin, MSY = NULL, one.index = NULL, qlegend = TRUE,
  stamp = get.version())
```

Arguments

inpin	An input list containing data.
MSY	Value of MSY.
one.index	Integer indicating the number of the index to plot.
qlegend	If TRUE legend explaining colours of observation data is plotted.
stamp	Stamp plot with this character string.

Value

Nothing

plotspict.diagnostic	<i>Plot model diagnostic (data, residuals, and more)</i>
----------------------	--

Description

Plot model diagnostic (data, residuals, and more)

Usage

```
plotspict.diagnostic(rep, lag.max = 4, qlegend = TRUE,
  plot.data = TRUE, mfcol = FALSE, stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
lag.max	Maximum lag to use in acf calculations.
qlegend	If TRUE plot a legend showing quarter of year information.
plot.data	If TRUE plot data in the top row (this option is only applied if osa residuals have been calculated).
mfcol	If TRUE plot plots columnwise (FALSE => rowwise).
stamp	Stamp plot with this character string.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.diagnostic(rep)
```

plotspict.f	<i>Plot estimated fishing mortality.</i>
-------------	--

Description

Plot estimated fishing mortality.

Usage

```
plotspict.f(rep, logax = FALSE, main = "Absolute fishing mortality",
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE, xlab = "Time",
  ylab = NULL, rel.axes = TRUE, rel.ci = TRUE,
  stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
plot.obs	If TRUE observations are plotted.
qlegend	If TRUE legend explaining colours of observation data is plotted.
xlab	Label of x-axis.
ylab	Label of y-axis.
rel.axes	Plot secondary y-axis containing relative level of F.
rel.ci	Plot confidence interval for relative level of F.
stamp	Stamp plot with this character string.

Details

Plots estimated fishing mortality with Fmsy and associated confidence interval.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.f(rep)
```

plotspict.fb	<i>Plot fishing mortality versus biomass.</i>
--------------	---

Description

Plot fishing mortality versus biomass.

Usage

```
plotspict.fb(rep, logax = FALSE, plot.legend = TRUE,
  man.legend = TRUE, ext = TRUE, rel.axes = FALSE, xlim = NULL,
  ylim = NULL, labpos = c(1, 1), xlabel = NULL,
  stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
logax	Take log of x and y-axes? default: FALSE
plot.legend	Plot legend explaining triangle.
man.legend	Plot legend explaining management scenarios..
ext	Add relative level axis to top and right side.
rel.axes	Plot axes in relative levels instead of absolute.
xlim	Limits of x-axis.
ylim	Limits of y-axis.
labpos	Positions of time stamps of start and end points as in pos in text().
xlabel	Label of x-axis. If NULL not used.
stamp	Stamp plot with this character string.

Details

Plots estimated fishing mortality as a function of biomass together with reference points and the prediction for next year given a constant F. The equilibrium biomass for F fixed to the current value is also plotted.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.fb(rep)
```

plotspict.ffmsy	<i>Plot estimated relative fishing mortality.</i>
-----------------	---

Description

Plot estimated relative fishing mortality.

Usage

```
plotspict.ffmsy(rep, logax = FALSE,
  main = "Relative fishing mortality", ylim = NULL, plot.obs = TRUE,
  qlegend = TRUE, lineat = 1, xlab = "Time", stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
plot.obs	If TRUE observations are plotted.
qlegend	If TRUE legend explaining colours of observation data is plotted.
lineat	Draw horizontal line at this y-value.
xlab	Label of x-axis.
stamp	Stamp plot with this character string.

Details

Plots estimated fishing mortality with Fmsy and associated confidence interval.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.ffmsy(rep)
```

plotspict.growth	<i>Plot estimated time-varying growth</i>
------------------	---

Description

Plot estimated time-varying growth

Usage

```
plotspict.growth(rep, logax = FALSE, main = "Time-varying growth",  
  ylim = NULL, xlim = NULL, xlab = "Time", plot.ci = TRUE,  
  stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
logax	Take log of y-axis? default: FALSE
main	Title of plot.
ylim	Limits for y-axis.
xlim	Limits for x-axis.
xlab	Label of x-axis.
plot.ci	If TRUE 95% CIs are included.
stamp	Stamp plot with this character string.

Details

Plots estimated time-varying growth

Value

Nothing.

plotspict.infl	<i>Plots influence statistics of observations.</i>
----------------	--

Description

Plots influence statistics of observations.

Usage

```
plotspict.infl(rep, stamp = get.version())
```

Arguments

rep	A valid result from calc.influence().
stamp	Stamp plot with this character string.

Details

TBA

Value

Nothing.

plotspict.inflsum	<i>Plots summary of influence statistics of observations.</i>
-------------------	---

Description

Plots summary of influence statistics of observations.

Usage

```
plotspict.inflsum(rep, stamp = get.version())
```

Arguments

rep	A valid result from calc.influence().
stamp	Stamp plot with this character string.

Details

TBA

Value

Nothing.

plotspict.likprof	<i>Plots result of likelihood profiling.</i>
-------------------	--

Description

Plots result of likelihood profiling.

Usage

```
plotspict.likprof(input, logpar = FALSE, stamp = get.version())
```

Arguments

input	Result of running likprof.spict().
logpar	If TRUE log of parameters are shown.
stamp	Stamp plot with this character string.

Details

TBA

Value

Nothing but shows a plot.

plotspict.osar	<i>Plot one-step-ahead residuals</i>
----------------	--------------------------------------

Description

Plot one-step-ahead residuals

Usage

```
plotspict.osar(rep, collapse.I = TRUE, qlegend = TRUE)
```

Arguments

rep	A result report as generated by running fit.spict.
collapse.I	Collapse index residuals into one plot. Default: TRUE.
qlegend	Plot legend for quarters.

Details

Plots observed versus predicted catches.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.osar(rep)
```

plotspict.priors	<i>Plot priors and posterior distribution.</i>
------------------	--

Description

Plot priors and posterior distribution.

Usage

```
plotspict.priors(rep, do.plot = 4, stamp = get.version())
```

Arguments

rep	A result from fit.spict.
do.plot	Integer defining maximum number of priors to plot.
stamp	Stamp plot with this character string.

Value

Nothing

plotspict.production	<i>Plot theoretical production curve and estimates.</i>
----------------------	---

Description

Plot theoretical production curve and estimates.

Usage

```
plotspict.production(rep, n.plotyears = 40, main = "Production curve",
  stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
n.plotyears	Plot years next to points if number of points is below n.plotyears. Default: 40.
main	Title of plot.
stamp	Stamp plot with this character string.

Details

Plots the theoretical production curve (production as a function of biomass) as calculated from the estimated model parameters. Overlaid is the estimated production/biomass trajectory.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.production(rep)
```

plotspict.retro	<i>Plot results of retrospective analysis</i>
-----------------	---

Description

Plot results of retrospective analysis

Usage

```
plotspict.retro(rep, stamp = get.version())
```

Arguments

rep	A valid result from fit.spict.
stamp	Stamp plot with this character string.

Value

Nothing

plotspict.season	<i>Plot the mean F cycle</i>
------------------	------------------------------

Description

Plot the mean F cycle

Usage

```
plotspict.season(rep, stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
stamp	Stamp plot with this character string.

Details

If seasonal data are available the seasonal cycle in the fishing mortality can be estimated. This function plots this mean F cycle.

Value

Nothing.

plotspict.tc	<i>Plot time constant.</i>
--------------	----------------------------

Description

Plot time constant.

Usage

```
plotspict.tc(rep, main = "Time to Bmsy", stamp = get.version())
```

Arguments

rep	A result report as generated by running fit.spict.
main	Title of plot.
stamp	Stamp plot with this character string.

Details

Plots the time required for the biomass to reach a certain proportion of Bmsy. The time required to reach 95% of Bmsy is highlighted.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.tc(rep)
```

pol

Fisheries data included in Polacheck et al. (1993).

Description

Fisheries data included in Polacheck et al. (1993).

Usage

```
data(pol)
```

Format

Data are lists containing data and initial values for estimation formatted to be used as an input to `fit.spict()`.

Details

Fisheries data for south Atlantic albacore, northern Namibian hake, and New Zealand rock lobster.

Source

Polacheck et al. (1993), Canadian Journal of Fisheries and Aquatic Science, vol 50, pp. 2597-2607.

Examples

```
data(pol)
rep <- fit.spict(inp=pol$albacore)
rep <- fit.spict(inp=pol$hake)
rep <- fit.spict(inp=pol$lobster)
```

pred.catch	<i>Predict the catch of the prediction interval specified in inp</i>
------------	--

Description

Predict the catch of the prediction interval specified in inp

Usage

```
pred.catch(repin, fmsyfac = 1, get.sd = FALSE, exp = FALSE,
           dbg = 0)
```

Arguments

fmsyfac	Projection are made using $F = \text{fmsyfac} * F_{\text{msy}}$.
get.sd	Get uncertainty of the predicted catch.
exp	If TRUE report exp of log predicted catch.
dbg	Debug flag, dbg=1 some output, dbg=2 more ourput.
rep	Result list as output from fit.spict().

Value

A vector containing predicted catch (possibly with uncertainty).

predict.b	<i>Helper function for sim.spict().</i>
-----------	---

Description

Helper function for sim.spict().

Usage

```
## S3 method for class 'b'
predict(B0, F0, gamma, m, K, n, dt, sdb, btype)
```

Arguments

B0	Initial biomass.
F0	Fishing mortality.
gamma	gamma parameter in Fletcher's Pella-Tomlinson formulation.
m	m parameter in Fletcher's Pella-Tomlinson formulation.
K	Carrying capacity.

n	Pella-Tomlinson exponent.
dt	Time step.
sdb	Standard deviation of biomass process.
btype	If 'lamperti' use Lamperti transformed equation, if 'naive' use naive formulation.

Value

Predicted biomass at the end of dt.

predict.logf	<i>Helper function for sim.spict().</i>
--------------	---

Description

Helper function for sim.spict().

Usage

```
## S3 method for class 'logf'
predict(logF0, dt, sdf, efforttype)
```

Arguments

logF0	Fishing mortality.
dt	Time step.
sdf	Standard deviation of F process.
efforttype	If 1 use diffusion on logF, if 2 use diffusion of F with state dependent noise (this induces the drift term $-0.5*sdf^2$ in log domain)

Value

Predicted F at the end of dt.

predict.logmre	<i>Helper function for sim.spict().</i>
----------------	---

Description

Helper function for sim.spict().

Usage

```
## S3 method for class 'logmre'
predict(logmre0, dt, sdm, psi, logm)
```

Arguments

logmre0	Initial value
dt	Time step.
sdm	Standard deviation of mre process.
psi	Degree of attraction toward mean.
logm	Mean logm.

Value

Predicted mre at the end of dt.

print.spictcls	<i>Output a summary of a fit.spict() run.</i>
----------------	---

Description

Output a summary of a fit.spict() run.

Usage

```
## S3 method for class 'spictcls'
print(x, ...)
```

Arguments

x	A result report as generated by running fit.spict.
...	additional arguments affecting the summary produced.

Value

Nothing.

prop.F	<i>Calculate management for changing F by a given factor.</i>
--------	---

Description

Calculate management for changing F by a given factor.

Usage

```
prop.F(fac, inpin, repin, maninds, corF = FALSE, dbg = 0)
```

Arguments

fac	Factor to multiply current F with.
inpin	Input list.
repin	Results list.
maninds	Indices of time vector for which to apply management.
corF	Make correction to F process such that the drift ($-0.5*sdf^2*dt$) is cancelled and F remains constant in projection mode
dbg	Debug flag, dbg=1 some output, dbg=2 more output.

Value

List containing results of management calculations.

put.ax	<i>Adds the x-axis to influence plots</i>
--------	---

Description

Adds the x-axis to influence plots

Usage

```
put.xax(rep)
```

Arguments

rep	A valid result from calc.influence().
-----	---------------------------------------

Details

TBA

Value

Nothing.

read.aspic	<i>Reads ASPIC input file.</i>
------------	--------------------------------

Description

Reads ASPIC input file.

Usage

```
read.aspic(filename)
```

Arguments

filename	Path of the ASPIC input file.
----------	-------------------------------

Details

Reads an input file following the ASPIC 7 format described in the ASPIC manual (found here <http://www.mhprager.com/aspic.html>).

Value

A list of input variables that can be used as input to `fit.spict()`.

Examples

```
## Not run:
filename <- 'YFT-SSE.a7inp' # or some other ASPIC 7 input file
inp <- read.aspic(filename)
rep <- fit.spict(inp)
summary(rep)
plot(rep)

## End(Not run)
```

read.aspic.res	<i>Reads the parameter estimates of an Aspic result file.</i>
----------------	---

Description

Reads the parameter estimates of an Aspic result file.

Usage

```
read.aspic.res(filename)
```

Arguments

filename Name of the Aspic result file to read

Details

TBA

Value

Vector containing the parameter estimates.

refpointci	<i>Draw CI around a reference point using polygon</i>
------------	---

Description

Draw CI around a reference point using polygon

Usage

```
refpointci(t, ll, ul, cicol = "ivory2")
```

Arguments

t Time vector.
ll Lower limit.
ul Upper limit.
cicol Colour of polygon

Value

Spline design matrix.

remove.priors	<i>Removes priors from an input list</i>
---------------	--

Description

Removes priors from an input list

Usage

```
remove.priors(inp, priors = "all")
```

Arguments

inp	An input list containing data.
priors	Priors to remove. By default ('all') all priors are removed.

Value

Inp list without priors.

Author(s)

T.K. Mildenberger <t.k.mildenberger@gmail.com>

res.diagn	<i>Helper function for calc.osar.resid that calculates residual statistics.</i>
-----------	---

Description

Helper function for calc.osar.resid that calculates residual statistics.

Usage

```
res.diagn(resid, id, name = "")
```

Arguments

resid	Residuals from either catches or indices.
id	Identifier for residuals e.g. "C".
name	Identifier that will be used in warning messages.

Value

List containing residual statistics in 'diagn', shapiro output in 'shapiro', and bias output in 'bias'.

retro	<i>Conduct retrospective analysis</i>
-------	---------------------------------------

Description

Conduct retrospective analysis

Usage

```
retro(rep, nretroyear = 5)
```

Arguments

rep	A valid result from fit.spict.
nretroyear	Number of years of data to remove (this is also the total number of model runs).

Details

A retrospective analysis consists of estimating the model with later data points removed sequentially one year at a time.

Value

A rep list with the added key retro containing the results of the retrospective analysis. Use plot-spict.retro() to plot these results.

Examples

```
data(pol)
inp <- pol$albacore
rep <- fit.spict(inp)
rep <- retro(rep, nretroyear=6)
plotspict.retro(rep)
```

season.cols	<i>Load season colors.</i>
-------------	----------------------------

Description

Load season colors.

Usage

```
season.cols(modin)
```

Arguments

modin Time vector modulo 1.

Value

Vector containing season colors.

shaperate2meanvar	<i>Convert shape and rate of gamma distribution to mean and variance</i>
-------------------	--

Description

Convert shape and rate of gamma distribution to mean and variance

Usage

shaperate2meanvar(shape, rate)

Arguments

shape Shape parameter
rate Rate parameter (scale = 1/rate).

Value

Vector containing mean and var parameters.

shorten.inp	<i>Shorten time series of input data to specified length</i>
-------------	--

Description

Shorten time series of input data to specified length

Usage

shorten.inp(inp, mintime = NULL, maxtime = NULL)

Arguments

inp An input list containing data.
mintime Minimum time to include in the modified data (default: NULL).
maxtime Maximum time to include in the modified data (default: NULL).

Details

Time is given in decimal notation (e.g. 2005.3). If only one of the arguments 'minyear' or 'maxyear' is used, the function shortens the time series from either end to the respective time.

Value

Inp list with shortened time series.

Author(s)

T.K. Mildenerberger <t.k.mildenerberger@gmail.com>

sim.eq	<i>Simulate equilibrium population dynamics based on a spict assessment</i>
--------	---

Description

Simulate equilibrium population dynamics based on a spict assessment

Usage

```
sim.eq(rep, logF, nobs = 100, opt = 1)
```

Arguments

rep	Result of fit.spict().
logF	Fishing mortality in log scale.
nobs	Number of years to simulate (default: 100)
opt	Flag to return average catch over last 5 years (if set to 1, default), or to return catch and biomass (if set to 2).

Value

If opt == 1 function returns average catch over last 5 years of the simulation period, if opt == 2 function returns catch and biomass over whole simulation period.

Author(s)

T.K. Mildenerberger <t.k.mildenerberger@gmail.com>

sim.spict	<i>Simulate data from Pella-Tomlinson model</i>
-----------	---

Description

Simulate data from Pella-Tomlinson model

Usage

```
sim.spict(input, nobs = 100)
```

Arguments

input	Either an inp list with an ini key (see ?check.inp) or a rep list where rep is the output of running fit.spict().
nobs	Optional specification of the number of simulated observations.

Details

Simulates data using either manually specified parameters values or parameters estimated by fit.spict().

Manual specification: To specify parameters manually use the inp\$ini format similar to when specifying initial values for running fit.spict(). Observations can be simulated at specific times using inp\$timeC and inp\$timeI. If these are not specified then the length of inp\$obsC or inp\$obsI is used to determine the number of observations of catches and indices respectively. If none of these are specified then nobs observations of catch and index will be simulated evenly distributed in time.

Estimated parameters: Simply take the output from a fit.spict() run and use as input to sim.spict().

Value

A list containing the simulated data.

Examples

```
data(pol)
repin <- fit.spict(pol$albacore)
# Simulate a specific number of observations
inp <- list()
inp$dteuler <- 1/4 # To reduce calculation time
inp$ini <- repin$inp$ini
inp$ini$logF <- NULL
inp$ini$logB <- NULL
set.seed(1)
sim <- sim.spict(inp, nobs=150)
repsim <- fit.spict(sim)
summary(repsim) # Note true values are listed in the summary
plot(repsim) # Note true states are shown with orange colour

# Simulate data with seasonal F
```

```
inp <- list()
inp$dteuler <- 1/4
inp$nseasons <- 2
inp$splineorder <- 1
inp$obsC <- 1:80
inp$obsI <- 1:80
inp$ini <- repin$inp$ini
inp$ini$logF <- NULL
inp$ini$logB <- NULL
inp$ini$logphi <- log(2) # Seasonality introduced here
inp <- check.inp(inp)
sim2 <- sim.spict(inp)
par(mfrow=c(2, 1))
plot(sim2$obsC, typ='l')
plot(sim2$obsI[[1]], typ='l')
```

spict

Fits a continuous-time surplus production model to data

Description

Fits a continuous-time surplus production model to data

Author(s)

Martin W. Pedersen <mawp@dtu.dk>

Examples

```
rep <- test.spict()
```

spict2DLMtool

Get function to estimate TAC for the DLMtool package

Description

This function creates harvest control rules (HCRs) which can be incorporated into a management strategy evaluation framework (DLMtool package). HCRs are saved with a generic name to the global environment and name of HCR is returned if results of the function are assigned to an object. HCR runs a SPiCT assessment using catch and relative biomass index observations and stock status estimates are used to set the TAC for the next year. TAC can be based on the distribution of predicted catches (percentileC) and/or the distribution of the Fmsy reference level (percentileFmsy). Additionally, a cap can be applied to account for low biomass levels (below Bmsy). Arguments of returned function are 'x' - the position in a data-limited methods data object, 'Data' - the data-limited methods data object (see DLMtool), and 'reps' - the number of stochastic samples of the TAC recommendation (not used for this HCR). One or several arguments of the function can be provided as vectors to generate several HCRs at once (several vectors have to have same length).

Usage

```
spict2DLMtool(fractileC = 0.5, fractileFFmsy = 0.5,
  fractileBBmsy = 0.5, uncertaintyCap = FALSE, lower = 0.8,
  upper = 1.2, env = globalenv())
```

Arguments

fractileC	The fractile of the catch distribution to be used for setting TAC. Default is median (0.5).
fractileFFmsy	The fractile of the distribution of F/Fmsy. Default is 0.5 (median).
fractileBBmsy	The fractile of the distribution of B/Bmsy. Default is 0.5 (median).
uncertaintyCap	Logical; If true TAC is bound between two values set in lower and upper. Default: FALSE.
lower	lower bound of the uncertainty cap. Default is 0.8, used if uncertaintyCap = TRUE.
upper	upper bound of the uncertainty cap. Default is 1.2, used if uncertaintyCap = TRUE.
env	environment where the harvest control rule function(s) are assigned to.

Value

A function which can estimate TAC recommendations based on SPiCT assessment, taking assessment uncertainty into account.

Examples

```
## Not run:
## Put together an operating model from the available DLM toolkit examples
StockEx <- Herring
FleetEx <- Generic_IncE
ObsEx <- Precise_Unbiased
## Remove changes in life history parameters
StockEx@Mgrad <- c(0,0)
StockEx@Kgrad <- c(0,0)
StockEx@Linfggrad <- c(0,0)
StockEx@Prob_staying <- c(1,1)
## Set the depletion level
StockEx@D <- c(0.3, 0.4)
## create Operation Model
OMex <- new("OM", Stock = StockEx, Fleet = FleetEx,
            Obs = ObsEx)
## Set simulation options
OMex@nsim <- 10
OMex@nyears <- 25
OMex@proyears <- 5
## Get SPiCT HCR
MPname <- spict2DLMtool(fractileC=0.3)
## run MSE
MSEex <- runMSE(OMex,
                MPs = MPname,
                timelimit = 150,
                CheckMPs = FALSE)
## example plot of results
Pplot2(MSEex, traj="quant", quants=c(0.2, 0.8))

## End(Not run)
```

spictcls

An S4 class to represent output from a SPiCT fit.

Description

An S4 class to represent output from a SPiCT fit.

summary.spictcls

Output a summary of a fit.spict() run.

Description

Output a summary of a fit.spict() run.

Usage

```
## S3 method for class 'spictcls'
summary(object, ...)
```

Arguments

`object` A result report as generated by running `fit.spict`.
`...` additional arguments affecting the summary produced.

Details

The output includes the parameter estimates with 95

Value

Nothing. Prints a summary to the screen.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
summary(rep)
```

sumspict.diagnostics	<i>Diagnostics table</i>
----------------------	--------------------------

Description

Diagnostics table

Usage

```
sumspict.diagnostics(rep, ndigits = 8)
```

Arguments

`rep` A result report as generated by running `fit.spict`.
`ndigits` Present values with this number of digits after the dot.

Value

data.frame containing diagnostics information.

sumspict.drefpoints	<i>Deterministic reference points of a fit.spict() run.</i>
---------------------	---

Description

Deterministic reference points of a fit.spict() run.

Usage

```
sumspict.drefpoints(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing deterministic reference points.

sumspict.fixedpars	<i>Fixed parameters table.</i>
--------------------	--------------------------------

Description

Fixed parameters table.

Usage

```
sumspict.fixedpars(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing fixed parameter information.

sumspict.ini	<i>Sensitivity to the initial parameter values</i>
--------------	--

Description

Sensitivity to the initial parameter values

Usage

```
sumspict.ini(rep, numdigits)
```

Arguments

rep	A result report as generated by running fit.spict.
numdigits	Present values with this number of digits after the dot.

Value

list containing diagnostics information.

sumspict.parest	<i>Parameter estimates of a fit.spict() run.</i>
-----------------	--

Description

Parameter estimates of a fit.spict() run.

Usage

```
sumspict.parest(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing parameter estimates.

sumspict.predictions	<i>Predictions of a fit.spict() run.</i>
----------------------	--

Description

Predictions of a fit.spict() run.

Usage

```
sumspict.predictions(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing predictions.

sumspict.priors	<i>Fixed parameters table.</i>
-----------------	--------------------------------

Description

Fixed parameters table.

Usage

```
sumspict.priors(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing fixed parameter information.

sumspict.srefpoints	<i>Stochastic reference points of a fit.spict() run.</i>
---------------------	--

Description

Stochastic reference points of a fit.spict() run.

Usage

```
sumspict.srefpoints(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing stochastic reference points.

sumspict.states	<i>State estimates of a fit.spict() run.</i>
-----------------	--

Description

State estimates of a fit.spict() run.

Usage

```
sumspict.states(rep, ndigits = 8)
```

Arguments

rep	A result report as generated by running fit.spict.
ndigits	Present values with this number of digits after the dot.

Value

data.frame containing state estimates.

take.c	<i>Calculate management when taking a constant catch (proxy for setting a TAC).</i>
--------	---

Description

Calculate management when taking a constant catch (proxy for setting a TAC).

Usage

```
take.c(catch, inpin, repin, dbg = 0, sdfac = 0.001, catchList = NULL)
```

Arguments

catch	Take this catch 'dtpredc' ahead from manstart time
inpin	Input list.
repin	Results list.
dbg	Debug flag, dbg=1 some output, dbg=2 more output.
sdfac	Take catch with this 'stdevfacC' (default = 1e-3)

Value

List containing results of management calculations.

test.spict	<i>Example of a spict analysis.</i>
------------	-------------------------------------

Description

Example of a spict analysis.

Usage

```
test.spict(dataset = "albacore")
```

Arguments

dataset	Specify one of the three test data sets: 'albacore', 'hake', 'lobster'. These can be accessed with the command data(pol).
---------	---

Details

Loads a data set, fits the model, calculates one-step-ahead residuals, plots the results.

Value

A result report as given by fit.spict().

Examples

```
rep <- test.spict()
```

trans2real

Get real parameter values from transformed ones.

Description

Get real parameter values from transformed ones.

Usage

```
trans2real(vals, nms, chgnms = TRUE)
```

Arguments

vals	Parameters in transformed domain.
nms	Names of transformed parameters (including log etc.)
chgnms	Remove transformation indication from the parameter names (e.g. remove log from logK).

Value

Parameter values in the natural domain.

true.col

Load color of true values from simulation.

Description

Load color of true values from simulation.

Usage

```
true.col()
```

Value

Color vector

txt.stamp	<i>Add spict version to plot</i>
-----------	----------------------------------

Description

Add spict version to plot

Usage

```
txt.stamp(string = get.version(), cex = 0.5, do.flag = NULL,
          new.flag = TRUE)
```

Arguments

string	Character string to stamp.
cex	Stamp cex.
do.flag	If NULL stamp will be added if not in a multi plot, i.e. <code>mean(par())\$mfrow > 1</code> .
new.flag	Flag to plot the stamp in the current (if TRUE, default) or new plotting window (if FALSE).

Value

Nothing

validate.spict	<i>Simulate data and reestimate parameters</i>
----------------	--

Description

Simulate data and reestimate parameters

Usage

```
validate.spict(inp, nsim = 50, invec = c(15, 60, 240), estinp = NULL,
              backup = NULL, df.out = FALSE, summ.ex.file = NULL,
              type = "nobs", parnames = NULL, exp = NULL, mc.cores = 8,
              model = "spict")
```

Arguments

<code>inp</code>	An <code>inp</code> list with an <code>ini</code> key (see <code>?check.inp</code>). If you want to use estimated parameters for the simulation create the <code>inp\$ini</code> from the <code>pl</code> key of a result of <code>fit.spict()</code> .
<code>nsim</code>	Number of simulated data sets in each batch.
<code>invec</code>	Vector containing the number of simulated observations of each data set in each batch.
<code>estinp</code>	The estimation uses the true parameters as starting guess. Other initial values to be used for estimation can be specified in <code>estinp\$ini</code> .
<code>backup</code>	Since this procedure can be slow a filename can be specified in <code>backup</code> where the most recent results will be available.
<code>df.out</code>	Output data frame instead of list.
<code>summ.ex.file</code>	Save a summary example to this file (to check that parameters have correct priors or are fixed).
<code>type</code>	Specify what type of information is contained in <code>invec</code> . If <code>type == 'nobs'</code> then <code>invec</code> is assumed to be a vector containing the number of simulated observations of each data set in each batch. If <code>type == 'logsd'</code> then <code>invec</code> is assumed to be a vector containing values of <code>logsd</code> over which to loop.
<code>parnames</code>	Vector of parameter names to extract stats for.
<code>exp</code>	Should <code>exp</code> be taken of parameters?
<code>mc.cores</code>	Number of cores to use.
<code>model</code>	If <code>'spict'</code> estimate using SPiCT. If <code>'meyermillar'</code> estimate using the model of Meyer & Millar (1999), this requires <code>rjags</code> and <code>coda</code> packages.

Details

Given input parameters simulate a number of data sets. Then estimate the parameters from the simulated data and compare with the true values. Specifically, the one-step-ahead residuals are checked for autocorrelation and the confidence intervals of the estimated `Fmsy` and `Bmsy` are checked for consistency.

WARNING: One should simulate at least 50 data sets and preferably more than 100 to obtain reliable results. This will take some time (potentially hours).

Value

A list containing the results of the validation with the following keys:

- `"osarpvals"` P-values of the Ljung-Box test for uncorrelated one-step-ahead residuals.
- `"*msyci"` Logical. TRUE if the true value of `B/Fmsy` was inside the 95% confidence interval for the estimate, otherwise FALSE
- `"*msyciw"` Width of the 95% confidence interval of the estimate of `Bmsy/Fmsy`.

Examples

```
data(pol)
rep0 <- fit.spict(pol$albacore)
inp <- list()
inp$ini <- rep0$pl
set.seed(1234)
validate.spict(inp, nsim=10, invec=c(30, 60), backup='validate.RData')
```

validation.data.frame *Collect results from the output of running validate.spict.*

Description

Collect results from the output of running validate.spict.

Usage

```
validation.data.frame(ss)
```

Arguments

ss Output from validation.spict.

Value

A data frame containing the formatted validation results.

warning.stamp *Add warning sign to plot*

Description

Add warning sign to plot

Usage

```
warning.stamp()
```

Value

Nothing

write.aspic	<i>Takes a SPiCT input list and writes it as an Aspic input file.</i>
-------------	---

Description

Takes a SPiCT input list and writes it as an Aspic input file.

Usage

```
write.aspic(input, filename = "spictout.a7inp", verbose = FALSE)
```

Arguments

input	List of input variables or the output of a simulation using sim.spict().
filename	Name of the file to write.
verbose	If true write information to screen.

Details

TBA

Value

Noting.

Examples

```
data(pol)
sim <- (pol$albacore)
write.aspic(sim)
```

write.bug.file	<i>Write the BUGS code to a text file</i>
----------------	---

Description

Write the BUGS code to a text file

Usage

```
write.bug.file(priors, fn = "tmp.bug")
```

Arguments

priors	List of priors, typically coming from inp\$meyermillar\$priors.
fn	Filename of to put BUGS code in.

Details

The .bug file generated by this function contains code published in Meyer & Millar (1999).

Value

Nothing.
